1. Greetings

Yahoo group: EastTNAPRS
Date: 2005-05-24 20:04:57 UTC
From: Scott
Topic: 1 Message: 1

Thanks for the invite to join the E TN APRS group. I hope to learn and share a lot about APRS, and we hope to have a digi full time in McMinn Co sometime this year!

My personal station (which is not 24/7 yet) uses UI-VIEW32, a AEA PK-232MBX TNC, and sometimes is hooked up via the internet direct.

We have some club and area events coming up this year where APRS would be a big help, and will share those events here. Might even ask for some help!

73, NA4IT

4. Welcome to the East TN APRS discussion group!

Yahoo group: EastTNAPRS
Date: 2005-05-25 13:32:45 UTC
From: William McKeehan
Topic: 4 Message: 4

I want to thank you all for joining the discussion group. I know as HAMs, our first choice for communication should be radio, but I also know that with the the schedules that many of us keep, trying to get together on-the-air would be difficult.

This forum will give us the opportunity to ask questions whenever you think of them...and you will get an answer when someone has time to give the answer.

I would like to encourage everyone to put pictures of any trackers that you build into the Photo's section of this group; post reviews of hardware/software that you have used to the messages portion of the group for others to comment on and learn from.

The Links section has a few links already for sources of information about APRS; if you have a link that the group could benefit from, please add it to the list.

You know about an event comming up where monitoring via APRS may be interesting? Post a message to the group or put it on the calendar.

I want this group to be a place where any questions can be asked, so feel free to ask away.

From: William McKeehan
Topic: 5 Message: 5

Feel free to invite anyone to join this discussion group. I want it open to everyone...I would like to keep it contained to people in and around East TN, but other than that, send the site out to everyone.

If you go to http://groups.yahoo.com/group/EastTNAPRS you should see an "Invite" option on the left - this will let you easiy send invitations to a group of people.

6. Xastir basic setup

Yahoo group: EastTNAPRS
Date: 2005-05-25 13:47:19 UTC
From: William McKeehan
Topic: 6 Message: 6

Xastir is the software that I use.

X Amateur Station Tracking and Information Reporting.

Xastir is a program for receiving and plotting APRS position packets. Development is a collaborative effort of programmers from around the world. Xastir supports many map formats and is highly customizable.

Xastir runs on Windows/MacOSX/Linux/FreeBSD/Solaris/Lindows, with many more possible. It supports 125 map formats, several types of TNC's and weather stations, speech synthesizer, AX.25 networking (Soundmodem/Baycom/SCC!) and seven languages!. On Unix-like operating systems, you can run your weather station or GPS on a separate computer as well, which is good for those hams who are already short on serial ports.

Xastir is FREE! under the GPL license and comes with all source code.

To download and install Xastir on Windows, go here:
http://www.lintronix.com/winxastir/

Once you have Xastir installed, you will want to download some maps. I have my personal collection of maps made available on my web server:
http://mckeehan.homeip.net/xastirmaps/
(I would recomment everything in the 1-USABase and 2-TigerDownloads/TN directories)

Maps go in the Xastir Maps directory;
c:\cygwin\usr\local\share\xastir\maps

Once you have put new maps in the Maps directory, In Xastir, choose Maps - Reindex All Maps

To use these maps, In Xastir, choose Maps - Maps Chooser
Select the maps that you want to display. If you uncheck "Expand Dirs" then you can choose entire directories at a time - Xastir will only load the maps that are "in view".

To begin to see APRS data, you need to add and start an interface.

In Xastir, choose Interface - Interface Control
Click "Add"

For a soundcard interface,
Select "Networked AGWPE"
Assuming that you selected the defaults with the AGWPE install,

host is
localhost, port is 8000, Path 1 is RELAY,WIDE
I would suggest Activate on Startup and Allow Transmitting be selected.

For a GPS,
Select "Serial GPS"
Stand along GPS Port should be /dev/ttyS0 for com1:, /dev/ttyS1 for com2:
and so on.
Port Settings should be 4800 bps, Port Style 8,N,1
GPS should be setup for NMEA output @ 4800 bps.
I would again suggest Activate on Startup.

For an Internet APRS-IS server,
Select "Internet Server"
I use Host tennessee.aprs2.net, Port 10154.
I would suggest Activate on Startup, Allow Transmitting and Reconnect on NET failure be selected.
To transmit, you will have to enter in a pass-code. To generate this pass-code, you will need to start a Cygwin Bash Shell (Start - Programs - Cygwin - Cygwin Bash Shell) and enter the command:
/usr/local/bin/callpass CALLSIGN
where CALLSIGN is your callsign.

This should get you basically up and running with Xastir...it has a lot of settings that you can adjust and play with, so this is only the tip of the iceburg.

12. xastir

Yahoo group: EastTNAPRS
Date: 2005-05-26 18:54:43 UTC
From: ki4jqp
Topic: 12 Message: 12

Hi all,

I've got xastir working properly(almost). Have the tennesse.aprs2.net selected as the Interface, receiving data, playing with the features. Went back to the setup to confirm Imagemagic was incuded in the install, but tho I downloaded the Blount County files from William's web site, and put them in the maps directory, then reindexed all, they still don't show. Tried making a county directory, still no go. Do Wm's map formats need another library?

There are so many different map formats supported, I'll have to go check, but I was thinking that shapefiles were supported in the Cygwin install.

I built my installation from source, so it's not in sync with the network install that you performed.

Have you gone to Map - Map Chooser and selected the shapefiels in question? Do these shapefiles show up in your Map Chooser window (with Expand Dirs checked)?

No, they don't show up... I'll check the setup list and see what
installed, then add that library if I need it. Two general questions;
if I set up my desktop to be an aprs only dedicated machine, any
advantage to a 32 bit sound card over a 16? And should I be looking for
a 2m vertical as opposed to my lightweight beam? In other words, from a
base station will I just be aiming at a stationary digipeater?

From: William McKeehan
Topic: 18 Message: 20

I do use a usb-to-serial cable with my laptop; I bought the cheapest one I could find (about $20 at CompUSA) and have had no problems with it. Others have had a lot of problems.

But, with my laptop, I either use an internet connection or my TH-D700. When using the D700, I plug the GPS into it, so I only need one serial port on the laptop.

I think some other TNC's you can connect the GPS directly to the TNC also, I'm not familiar with other TNC's, so I can not comment much on that. ANYONE ELSE ON THE LIST HAVE SOME INFORMATION ABOUT THIS SETUP?

But, with Xastir, yes, you can put the GPS on one port and the TNC on another. So you would need a cable to go from the GPS to a serial port and a cable to go from the TNC to the computer...then another to go to the radio from the TNC.

Make sure the files are in the Xastir maps directory. I think that will be /usr/local/share/xastir/maps (in a bash shell), but it may be somewhere else with the installation that you did.

Let us know if you find the directory.

From everything that I am reading, the Shapefile support is built-in to the basic Xastir product, so you should not need any additional libraries.

Xastir was written for unix.

BUT

There is an application for Windows (free) that is called Cygwin. Cygwin is basically a unix shell inside of Windows.

Xastir then runs in this Cygwin environment. The setup of Cygwin is all graphical windows program, setting up Xastir does require you to open a Cygwin shell (like a DOS window), but the steps are minimal.

26. update

Yahoo group: EastTNAPRS
Date: 2005-05-29 01:40:55 UTC
From: ki4jqp
Topic: 26 Message: 26

Impatient, so I ordered a TinyTrak3, and the first of three cables- the Garmin Etrex to laptop data cable. The Garmin usb to RS232 adapter was way over priced, so I'm ordering a $10 one from New Egg.

The shapefiles are in the directory you specified, and were reindexed, but don't show up in the map chooser window. No matter, the Tiger map server and the geoserver give me all I need at this point anyway. The data is coming in torrents. Need to figure out how to turn off some pop up boxes with text from some ham in Ontario that's not on the map. It seems xastir picks up data from everywhere.

The spyware fiasco- may not have been the german site. For any of you familiar with spyware.. the Aurora and Cashback Buddy trojans have suspicious links (so the gurus say) to Yahoo and Adobe, and I've recently found on my puter two lite demo versions of Adobe products that I did not download, nor install from any cd. There are NO anti-spyware products as yet that can totally remove Aurora. You have to do a regedit and also manually remove an .exe and a .dll file in the Windows/Prefetch folder.

The Xastir manual is more of a configuration manual. It doesn't really tell you how to, for instance, toggle between multiple open maps. You figure it out by playing with it, and that makes it more fun when you stumble across a solution.

From: ki4jqp
Topic: 28 Message: 28

Per my missing ShapeLib. Went through all the download options in the Cygwin setup for net install, no Shapelib files. Then I remembered, I downoaded the Stable Xastir. Should I have downloaded the Developer package? It's still listed as Skip.

I've connected to the toposerver, the radar server, the Tiger server, but not the geoserver. Is it down alot? I'd love to get together sometime and watch you run through some basic stuff on your laptop. Too many questions aren't being answered just by playing with it. I don't get call sign overlays on the Tiger maps... I do on the toposerver.

Topic: 29 Message: 29

Hello all, I have for sale or trade a Pavilion N 5190 HP laptop for sale. This is my spare / old laptop, it has been replaced with a new Sony Vaio.

It has the following specifications -

Windows XP Pro.
700 Mhz Pentium 3 processor.
256 Meg of ram.
10 gig hard drive.
14.1 LCD flat screen.
DVD / CD ROM drive (not burner)
Floppy drive
Battery (works!) / AC Charger.
Polk audio speakers
2 PCMCIA sockets
2 USB ports
USB wireless Mouse and receiver.

This is a great machine; it has all the standard ports of a traditional computer have so this will make a great APRS, mobile packet or just a great laptop to have. It has a couple of minor things wrong with it, nothing major. The first problem is the I key pops out every so often, it just pops back in. The second is the speaker plug in (internal) is loose. You press on the top and the sound comes back. I will try to disassemble it and tighten it up if you want. It really doesnt bother me that much. I can give more info off line if you need it.

I am asking $450... or make a far and resonable offer.... but I would like to trade for a dual band radio something like ICOM IC-2720H, a Kenwood TM-D700A (preferred radio), TM-7VDual band or a Yaesu FT-8800R dual band. I am in need of the true dual receiver, cross band repeat abilities and the ability to use APRS. So if you have one these and are interested give me a call (865) 621-9317 cell or email at moebrewer@...

73, Moe N4CQW

The TT3 is a transmit only device. These devices have their place, but don't expect them to be a replacement for a TNC. You can get most of the cables that you need for a TT3 from the byonics web site; if you would preffer to build the cables yourself, they also have the wiring diagrams on their site.

As for the shapefiles...I may have given you the incorrect directory. Do a search for the terraserver.geo or the tigermap.geo files and see where they are. They should be in the proper Xastir maps directory and that may help you identify the correct place to put the shapefiles.

As for the APRS-IS feed; I had suggested tennessee2.aprs2.net port 10154. This port will give you all of the data for North America. There are other feeds available. Check this web site for a list of ports that tennessee2.aprs2.net supports:
http://tennessee2.aprs2.net:14501

One port in particular to pay attention to is 14580. This port is a filtered port. By default, it will give you no packets, in the Xastir interface definition, you can specify a filter to add packets to your view. For example, if you want to see everything within a 200 mile radius of your location, specify "m/200" in the filter field in the interface setup. For more information on the types and format of filters that you can have, check this site:
http://www.aprs-is.net/javAPRSSrvr/javaprsfilter.htm

> fun when you stumble across a solution.

Yes, the documentation for Xastir was written by the developers and is not as
complete as it could be. The good news is that Xastir is a community project,
so if you write documentation for it, you can contribute that back to the
project and make life easier for other users.

Maps in Xastir are fun to play with, and there are a lot of options. To start,
go to the menu "Maps - Map Chooser" you can select one or more maps, when you
click OK, those maps will be the maps that are displayed.

To be honest, I installed Xastir before it was a package under Cygwin, so I'm not really familiar with how they have those things packaged.

The developer package should give you all of the development libraries needed to compile Xastir from source. See the README.CVS for details on how to do that once you have the developers package installed.

32. [Fwd: UX-2 Launch Status]

Yahoo group: EastTNAPRS
Date: 2005-06-02 15:44:10 UTC
From: William McKeehan
Topic: 32 Message: 32

FYI - if you can chase the balloon, it's a lot of fun. If not, it's fun to watch from home as well.

---------- Original Message ----------
Subject: UX-2 Launch Status
From: "Daniel Bowen" <dbowen1@...>
Date: Wed, June 1, 2005 9:08 pm
To: "UTARC Chat" <chat@...>

Hello All,
UTARC's UX-2 is scheduled to launch at 9:00am this coming Saturday, June 4th, 2005. Launch site is Oliver Springs Airport (Braden Field) in Oliver Springs, TN. Site coordinates are: 36.037849N, 84.308127W. This site is 5 miles west of Oak Ridge, TN, driving directions will be posted on http://balloon.utarc.org. The launch site was hoped to be at the University of Tennessee Knoxville campus, however initial predictions from Bill Brown, WB8ELK, showed the landing site being near Gatlinburg in the Smoky Mountains. The prediction was for 30 miles travel in a southeasterly direction, and Oliver Springs Airport provides a quiet, out of the way airfield that is nestled at the western edge of the Tennessee Valley that should keep such a track in the valley.
This flight will consist mostly of the same hardware as UX-1, with a replacement GPS and additional tracking transmitters. Email will be sent out friday night with the landing site prediction for the recovery crew. Any further position estimates will be communicated via APRS or voice radio transmissions on the morning of launch. All information will be updated on the website until departure to the launch site. Launch and chase radio frequencies will be streaming live on the web via http://balloon.utarc.org and the live APRS position maps will be available as well.
Thanks,
Dan Bowen

> Why are you using the "old" RELAY,WIDE path rather than the "new"
> WIDE1-1,WIDE2-2 for mobile stations which has been promulgated by the APRS
> gurus (eg. Bob Bruninga) which is supposed to reduce duplicate packets?

Around here, I use a path of WIDE, if you use a path of WIDE2-2 (or anything similar), it will not get digi'd around East TN.

I'll expand...

My normal path for being mobile around here is a simple WIDE - with 10 watts of power. With that path and power setting, I will generally be heard and digi'd by WA4KJH-7; and what WA4KJH-7 hears, my home IGate, KI4HDU-2, will also hear, thus getting me where I want to be.

If I am traveling a little further out, I may use RELAY,WIDE. RELAY is what a home digi will set up as an alias, so this will let me take advantage of any home stations that may be setup as RELAY digi's. The WIDE digi's in East TN also support this alias, so if they hear me direct, they will also digi my packets.

If I am leaving East TN, then I run RELAY,WIDE and monitor closely; when I can hear a digi that does not digi my packets, I will try to change to WIDE2-2. This becomes necessary both in North Carolina and over near and past Nashville.

WIDE2-2 is becoming the new "standard" across the nation and RELAY and WIDE are being dropped by many digi's. This will not happen in our area any time soon; our digi's are using old TNC's that do not support the new WIDEn-N. For more details on this WIDEn-N thing, check this site:

http://web.usna.navy.mil/~bruninga/aprs/fix14439.html

While this may be a good idea, it only works if the local DIGI's support it.

From: David Hoffman
Topic: 33 Message: 34

I've been using RELAY,WIDE with five watts for many years. When I drove to Dayton Ohio and Ft. Wayne Indiana last month, I took this APRS station with me and made no changes to it, it seemed to work well. The only area that I wasn't heard, or relayed from, was the north-west corner of Ohio. I just figured that it was because there were no Digis in the area. I usually run the box without the laptop attached, so I don't normally monitor the other stations. I suppose if I hear other stations and do not hear myself, then I could pay special attention to what's in the area and see why this is. I do have the ability to setup four different beacons, I suppose I could do my normal way in one slot and then try the new way with another beacon slot. If I can figure out how to alternate between these two beacon slots and send out the same GPRMC sentence everytime, that would be the way to try it out. Then I could go back and see what was heard later. This has something to do with TIMESLICE, I think.

I read Bob Bruninga's article on "APRS at LARGE SPECIAL Events like DAYTON". This seems to demonstrate that you can have a very large number of APRS stations in an area and still utilize those running RELAY,WIDE. I can remember reading about this PATH thing many years ago, and I wasn't completely clear on what was best for any given area then.

This will take some experimenting.

35. Re: [EastTNAPRS] Re: PATH

Yahoo group: EastTNAPRS
Date: 2005-06-03 13:53:58 UTC
From: William McKeehan
Topic: 33 Message: 35

I agree with what you are saying. RELAY, WIDE has been around for years and even though an effort is underway to remove them, it will take a while for everyone to eliminate support for them. In general, that path will still work, but as time goes on, it is being supported by less and less digi's.

I've been working on a project in Memphis for the past couple of years. They are making the change there, so WIDE does not get anywhere out there.

I wrote a document on this topic and put it in the Files section of the EastTNAPRS group:
http://groups.yahoo.com/group/EastTNAPRS/files/

BTW, the reason that the WIDEn-N is "better" is the TNC's have logic in them to help prevent the same digi from sending the same packet out multiple times.

For example, let's say that your station is in range of two digi's. You send a packet with a path of RELAY, WIDE. This will result in the following packets being generated.

```
ME>APRS,RELAY,WIDE
ME>APRS,DIGI1*,WIDE
ME>APRS,DIGI2*,WIDE
ME>APRS,DIGI1*,DIGI2*
ME>APRS,DIGI2*,DIGI1*
```

With a path of WIDE2-2, the following packets would be generated:

```
ME>APRS,WIDE2-2
ME>APRS,DIGI1*WIDE2-1
ME>APRS,DIGI2*,WIDE2-1
```

Notice there are two less packets generated, but the packet has the same coverage area. This is very important in areas where the channel is saturated (we are not at that point in East TN).

But again, this only works with digi's where the WIDEn-N alias/dup suppression is supported.

I also agree that experimenting is key. Try a simple path and watch what happens with your packet; see what you hear back on RF and what makes it to the ARPS-IS.

Please also remember, a path longer than necessary to accomplish your goals will only be QRM to neighboring areas; for example, there's probably no reason for someone to hear your packet on RF over 400 miles away - especially with the proliferation of IGates.

True, but the distance between you and a digi as you travel or go mobile keeps changing. So what may work to get you in a digi with one or two hops may require 3 or more hops as you move from area to area, state to state.

I'm not sure I follow your comment. If you don't get to a digi, the number of hops in your path does not matter; you may have mean IGate as opposed to digi. In that case, I totally agree. In Knoxville, a simple 1-hop path of WIDE will get you to an IGate; in Crossville, you may need 2 or 3 hops.

I will add one more thought. It is easy to put up a one-way IGate - all you need is a receiver, computer and internet connection. With many people having full-time high-speed internet connections now, this is possible for many people. Most APRS software will has IGate functionality built-in.

A two-way IGate requires a little more, but not much. My IGate runs with an old computer running Linux and javAPRSSrvr, using only a 5W HT and a soundcard TNC.

As long as the IGates are configured properly (i.e., only transmit things to RF that need to be transmitted), there is no problem with having multiple IGates in any one area.

Cc: "bob wilson" <kk4xa@...>
"Bob Wilson" <bob.wilson@...>

There is a new launch site- which happens to be our 'old' launch site near Watts Bar Dam. Find the directions (again) below:

Directions:

I-75 to Exit 60 (TN Route 68). From the southband ramp turn right (Westbound) and stay on Route 68 for just under 15 miles to TN Route 304 SOUTH. Make a left turn onto SOUTH 304 and go .9 miles to Pinhook Ferry Road, which is on your right. The field will be on your left, but go to park at the end of the road at the boat ramp.

>From today's edition of the ARRL Letter:

* University students' first Amateur Radio balloon mission a success:

Members of the University of Tennessee Amateur Radio Club (AA4UT) launched their first balloon carrying Amateur Radio equipment on May 14. The team used APRS to track the balloon--designated UX-1--which had ATV equipment on board to provide a video feed back to Earth. The balloon reached an estimated altitude of approximately 52,000 feet (the GPS units would not read above 32,000 feet) and covered some 90 miles before bursting and descending by parachute. The balloon payload was recovered intact. Mike Coffey, KJ4Z, and Dan Bowen, K2VOL, were the prime movers behind the project. "This is an outstanding effort by young Amateur Radio operators in pursuit of their hobby," commented Tennessee Assistant Section Manager David Bower, K4PZT. Bower says the UT ham club has greatly benefited from the support of local radio amateurs dedicated to promoting Amateur Radio to younger licensees and prospective licensees. "Thanks to these local hams, they have an excellent HF amateur radio station at the University of Tennessee, including a tower and HF beam," Bower said. Another launch in the works for this weekend--June 4--may get media coverage by CNN. There's much more information, videos and photos on the UX-1 Web site <http://sunsite.utk.edu/~mcoffey/ux-1/>.

44. UX-2 APRS Activity?

Yahoo group: EastTNAPRS
Date: 2005-06-06 18:50:24 UTC
From: William McKeehan
Topic: 44 Message: 44

Did anyone collect packets from the balloon launch this past Saturday? I was out-of-town and unable to participate in the chase. It sounds like it was somewhat uneventful - I guess that everything worked well, but I have not heard any details. I would love to hear if any of you all had any success with tracking it.

Yes, here is what I heard from my APRS box.

It looks like the highest that you heard the balloon was at 52,844 feet and
you got less packets after that.

What's the assumed reason? Cold?

47. The ultimate ham-radio-oriented computer system

Yahoo group: EastTNAPRS
Date: 2005-06-06 22:07:15 UTC
From: William McKeehan
Topic: 47 Message: 47

This dedicated ham-radio-oriented computer system simultaneously hosts an Echolink radio-to-Internet interface, an APRS personal webserver, and an APRN (SSTV-to-Internet) gateway. The objective was a dedicated box that contains both the computer system and the associated radios packaged so that the only external connections are antennas, Internet and 12 VDC power.

Sorry Wm, too late. Deleted Xastir, and am trying UI-View. Also frustrated with Tiny Trak, in that I didn't see that the website made it at all clear that not only did I need to make or order cables, but that I needed the null-modem and gender changer plugs too. Would have ordered them all together, instead of piece meal. I understand TT3 is a transmit only. I had wondered if there was a way to easily switch back and forth from data to voice, but saw alot of folks were just attaching their tt's directly to a handheld. Since I have a VX-150 and there are premade cables at the TT site, I'm going that way. So I'll just be tracked for the time being, use my mobile rig for voice and the HT for the Etrex/TT. Xastir was just taking up more time than I had... still need a base unit, studying for my General, practice my code, compare meteorological software... etc. Too many options in this hobby.

I can understand why you would give up on Xastir. Without knowledge of Unix, it can be a bit involved...

I would like to hear about your experience with UI-View. I have it and have even registered it, but I can't make it work well enough to be of any use to me. It is the most popular piece of APRS software in use right now, so there must be something to it.

Let me know what maps you find to use with it...I think that's the thing that I really need to get me going.

That is why I was thinking that the cold got to the PocketTracker. But Dan says he's already made the VCO voltage modification to adjust for the cold. So I'm not sure why I didn't hear anything from the ballon on the decent. That's happened both times with this payload and this PocketTracker. It's a wonder we even found this payload. I had one position report from it on the way down, and that was at >30K feet. It was Bill Brown who got me closer with his calculations that allowed me to pick it up once again, but only after it was on the ground. You can see that by the packets I heard. Two of those packets came through KE4WFJ's station. (Interesting stuff)

If anyone is interested and available...

---------- Original Message ----------
Subject: Cherohala Challenge
From: "RICK COFFEY" <bacpacker@...>
Date: Mon, June 6, 2005 10:34 pm

Hello Folks,
I wanted to send a reminder early this week about the Cherohala Challenge bike ride on Saturday. The June 11th ride will begin at Tellico Plains High School at 7:30am. It follows a course for 115 miles back up into Blount County, takes Hwy 129, across the state line over to the Cherohala Skyway and back down to Tellico Plains School. There will also be a shorter ride leaving the school, climbing the Skyway then turning and coming back down to the school. This route is about 60 miles.

We have several open positions that need to be filled yet. There are 3 rest stops with no communications help. We can also use as many SAG vehicles as we can get for this ride. I have a list of folks who have signed up to help already, I will be calling each of you if I have not already done so to confirm your assistance and location. I have copies of the route sheets, a rough map of the ride, and am putting together a handout sheet with every ones name, call, position, and any frequency information I can come up with. This ride will test our skills due to the fact that a good portion of the course will have little or no repeater coverage. David Hoffman has agreed to set up his portable repeater at the highest rest stop along the course for use on as much of the course as it will cover. The last time some of our group worked this ride, we ended up using simplex between sags in some places. Everyone will need to be on their toes. We will have a 440 (David's repeater) NCS, as well as, a 2 meter NCS. We will start out on 146.940 for as long as it covers us. Again I am putting together a list of other possibilities we can try to switch between as the day goes on.

Anyone who has not signed up yet, please come out and help if you can, we will sure be able to use you for any or all of the event. We will have a final discussion during the net on Thursday night, 9:00pm, 146.940, please be sure and check in.

Thanks for your help

I do not understand why the WIDE digi's in the area were not hearing the packets. Is coverage simply that poor in that area?

KF4YMC - is that a digi or only a home station? If he were a digi or an IGate, that may have helped.

The station at the Athens EOC stations has trouble getting into an IGate...I wonder if NA4IT was running his IGate/digi this weekend.

Does anyone else have any packets that they collected from this past weekend's flight?

Yeah, it's a pretty amazing box - give it internet access and you can do a lot.

I'm working on a computer to add to my vehicle. I want this computer to take control of the radio(s) and act as a digi while also providing my laptop (and any other APRS stations within range) with a APRS-IS type feed via a wireless (802.11) connection. I have the basics of it working now...but it's not 12-volt, so I have to use an inverter. This will let me park my vehicle somewhere near by, then take my laptop over to a shady area and watch the action :-)

My config will be a Garmen Etrex to the TT3 to a Yaesu VX-150. The HT will be connected to a Diamond magmount identical to the one I use on my mobile rig, which has been very satisfactory.Have all the cables, waiting for Priority mail with the gender changer/null modem which apparently is needed to use the setup program from my pc's serial port. All the cables and hardware cost more than the tt3 itself (I wasn't ready to make my own cables). Live and learn. Testing either this weekend or next Mon or Tues.

It will not work on any version of Street Atlas after version 9.0.
Version 9.0 was the last good version for APRS+SA because of the new
interface. If you have the new interface such as on SA2003, 2004 or 2005,
it will not work.

A couple of questions for William,

What did you power your TinyTrak with? It says 9 volts, drawing 3 milliamps plus the l.e.d.'s at 3 ma each...

when I run the config utility, any must have's, such as wide, relay or whatever? I'll be at the Ares meeting Tuesday night, if you have a screen print of your config box. Otherwise it'd be great if you could just post em here. Thanks.

Think it's showing in the from box :-) Oh, you mean like KI4JQP-9,
guess that'll be it.

Also think I'll be all weekend configuring it, unless the APRS gods
shine down upon me and give me no problems... (disable this, enable
that, etc...)

Thanks a million for the screenshot, Wm. Two last questions, 1) which APRS data frequency do we use in our area? and 2) for testing on the bench, is a standard 9 volt battery sufficient? When I'm mobile the TT3 to Yaesu cable has a cigarette lighter adapter... but for testing I'll be applying power to the J1 DIN. The J3 board points, what could I use without soldering, for a temp power connection... those holes are mighty small.

A screen shot of my TT3 configuration is attached (I'm not sure if this will come to the list).

Before you take your TT3 "out in the field" be sure to test it throughly at home. Listen to it on another radio and make sure you have the two pots (R6 and R9, I believe) set correctly.

If you have been watching over the last couple of days, you've probably seen KI4HDU-9; that's my TT3 with a Yaesu VS-5R.

I've not played with using other power connections - I've always driven it with 12-14 volts. I have power-pole connectors on my TT3, so it's easy to add it to my power supply at home and I have power-poles in my vehicles also.

So I don't have any suggestions for you.

1) The frequency is 144.390

2) You can supply it with 7-35 volts DC on the input of the 78L05. Or you can give it a regulated 5 volts DC by not using the 78L05.

Power can be applied via the Vin + and ? points. The voltage regulator can handle 7-35 volts. At 12 volts, current draw is 6.6ma + 3ma for each LED lit. If desired, the 4 1K LED resistors can be replaced with 10K resistors, which will cause the LED to only draw about 0.5 ma each. If Q2, C3, & C4 were NOT installed on the board, 5V power can be applied via the +5 and GND points near the LEDs. Only 5V can be applied at this point.

Thanks, guys. I've ordered an Astron ss-12 from HRO which should be here Tuesday (can't bring myself to buy Radio Shack stuff) and I needed a bench supply anyway. I know it doesn't sound like it, but 40 years ago I built a number of Heathkits. I really think that APRS has something to offer me, so I'll stick it out, even if it takes a while. I'm sure I'll have a zillion Kantronics questions when I get to that point.

Not a problem, say, are you looking at a Kantronics TNC? That's what I use. I have the KPC3+.

That would be the one. Once I've got my base station set up in a few weeks, I'll look into what the possibilities are. Dunno if I want to install the Kantronics in a mobile config, or do something at home. Wireless weather station linked to my website or one of the NOAA weather nets. Gotta read the UI-View manual carefully to see what I might do with a "real" TNC

From everything I've seen on the APRSsig, it sounds like the KPC3+ is one of the best all-around TNC's to have.

How big is it?

Do you have just the one that you run mobile?

Subject: Re: Re: xastir

I can understand why you would give up on Xastir. Without knowledge of Unix,
it can be a bit involved...

I would like to hear about your experience with UI-View. I have it and have
even registered it, but I can't make it work well enough to be of any use to
me. It is the most popular piece of APRS software in use right now, so there
must be something to it.

Let me know what maps you find to use with it...I think that's the thing that
I really need to get me going

William,
I have just started using UIView32, having used WinAPRS until now. I
really like the program and it has the best support group on yahoo! NA4IT
(Scott) really gave it a great recommendation so I decided to try it. I have been
using an old Street Atlas program with it (v 7.0) and it does fine except for
mobile scrolling. I also have version 5 of Precision Mapping which I think
may enable autoscrolling for mobile use with the use of the PMAP server
add-on, but I haven't actually tried it yet mobile. I now have it running on my
fixed station and it has great maps. UIView32 also has many plug-ins for
added functionality like UI-Radar which overlays local radar and UI-NWS which
underlays the county warning areas. Also there is a Terraserver plug-in which
I have not tried yet, but Scott has used. If you use it, would recommend you
join the yahoo support group...much information to be had there, even though
the author of the program became a silent key last fall. You can use about
any map as long as you know the coordinates of the image corners or two
points within the map. You simply drag the map image file into the main window
and enter the coordinates into the dialogue box and it is available to use.
Each map has an image file and an .inf file which names the map and its
coverage area. Each station is announced in a British voice as it is added to the
station list. It has a much more intuitive and pleasant interface than
WinAPRS. The help file is exhaustive and easy for a newby to follow (unlike
WinAPRS). Although I don't yet qualify as an expert, I would be glad to help
anyway I can. Scott is really more an expert on it than I am at this point, but
I'm gaining on him!

75. GPS 18 OEM Product Reviews

Yahoo group: EastTNAPRS
Date: 2005-06-18 17:59:42 UTC
From: Moe Brewer
Topic: 75 Message: 75

Hi all, I was looking around at some differnt ideas for a GPS unit once I have the funds to spend for APRS stuff. Has any one used or seen this in use by anyone around here in our area?

" The GPS 18 is a GPS sensor targeted to OEM clients for use in automotive, fleet vehicle, and electronics applications where a small, highly accurate GPS receiver is needed.

This 12-parallel-channel, WAAS-enabled GPS receiver is available in either CMOS-level serial or USB 2.0 full-speed versions, and comes with an integrated magnetic base. The puck-like receiver is 2.4 inches in diameter and weighs just ounces, making it an ideal solution in applications where space is at a premium.

The GPS 18 is offered in three different cable configurations: A-style USB, DB-9 pin serial with 12-volt cigarette lighter adapter (PC), or bare wire (LVC). The PC and LVC versions both default to output data in the industry standard NMEA 0183 data format, but may also be user programmed to output data in the GARMIN proprietary format. The USB version produces data only in the GARMIN proprietary format. All three versions of the GPS 18 come complete with non-volatile memory for storage of configuration information, a real-time clock, and raw measurement output data for sophisticated customer applications. The LVC version additionally provides a pulse-per-second logic level output whose rising edge is aligned to the UTC second within 1 microsecond. The USB 2.0 full-speed version of the GPS18 is also compatible with USB 1.1 full-speed hosts."

http://www.garmin.com/products/gps18oem/index.jsp

http://www.eham.net/reviews/detail/4982

I am planning to basically use the APRS system mobile but will eventally have a APRS system at the house with a internet link (cable modem access here). I am thinking this will be easier to use mobile with the TT3 instead of having a seperate GPS unit... I am thinking of making a "box" to keep it portable.... making (buying) some type of reel to keep the cord neat but be able to extent the GPS receiver away from the box a little.... (William, could this work with 802.11b idea you were talking about?)

81. KF4CFO-7 to get "TEETH"

Yahoo group: EastTNAPRS
Date: 2005-06-20 02:31:30 UTC
From: Scott
Topic: 81 Message: 81

Well, hopefully sometime tomorrow afternoon (June 20th) KF4CFO-7 will have a brand new rig to operate APRS with. The old KDK has just about bit the dust. I have dealt with it for the last month with the output power going down, drifting sometimes up to 6kcs off frequency and the like.

The City of Athens Police Department donated the McMinn Co Amateur Radio Club the funds to get a new rig, an ADI AR147+, so hopefully that
will get the APRS going again as a useful digi between Knoxville and Chattanooga. We run UI-VIEW32 with a Kantronics KPC-3.

Be looking for it and send me some reports!

Scott NA4IT

83. Re: [EastTNAPRS] GPS 18 OEM Product Reviews

Yahoo group: EastTNAPRS
Date: 2005-06-20 14:40:38 UTC
From: William McKeehan
Topic: 75 Message: 83

I have used Garmin devices for years now and have been happy with them.

I have not used the GPS18. Everything that I have heard about it on other mailing lists indicate that is is a great GPS for APRS use. Note that it does not have a display - some would consider this a big deal.

For your home station, you will not need a GPS at all.

The GPS18 is ideal for use with the TT3, but keep your eyes on the byonics web site...I hear they are going to introduce a "plug-and-play" GPS for the TT3.

If you do use a TT3, you have to be careful about RF noise getting into the TT3.

This is very good news!

What aliases will this digi respond to? Give it's location, it would be nice
if it responded to both the new (WIDEn-N) and old (RELAY,WIDE).

Nope, other than not having a power supply. It arrived this afternoon.
Once I've soldered the leads to the temp adapter I'll be ready to
configure. I'll try to squeeze it in the next few days, but I'm trying
to get ready to go out of town Friday, so it'll probably be next week
before I'm trackable.

On the UNPROTO Beacon it is "APRS,RELAY,WIDE3-2". On the digipeater it is "KF4CFO-7,RELAY,WIDE2-2" with the sub-alias of "KF4CFO-7"(if I remember right...been a long day!). Let me know if it needs to be changed or something.

I've been watching KF4CFO-7 for a while tonight and it seems to be
working well. Of course their has been somewhat of a badn opening
also tonight. Everyone look at it and see what you think. I may have
it set a little "wide" if so I'll prune it a little. Trying to "fill
in" the valley, as for most it is hard to reach Cove Mtn or Signal
Mtn from this area.

90. APRS on Field Day

Yahoo group: EastTNAPRS
Date: 2005-06-21 14:21:15 UTC
From: William McKeehan
Topic: 90 Message: 90

Anyone planning to do anything special for Field Day with APRS?

Bob Bruninga is proposing that APRS stations QSY to 145.01 on FD.
See:
http://www.ew.usna.edu/~bruninga/aprs/fd2005.html
for more details.

I may try to listen on 145.01 to see if I hear anything, but unless
some of the big digi's in the area QSY to 145.01, I doubt that I will
be able to hear anything there.

I am planning to do a demonstration at the Smoky Mountain Amateur
Radio Club FD location in Maryville. I gave a presentation to that
group a couple of months ago and thought that a real-live
demonstration would be a good way to help them see how it works. I was
told that it would also give them some extra points for a) the
demonstration and b) digital QSO's.

If any of you are coming to the SMARC FD, bring along your APRS
equipment so we can do a little look-see to see how the different
setups work.

I will not say that it needs to be changed...but I would like to understand your logic in using WIDE3-2 in the UNPROTO path.

With that setting you should get 3 hops, RELAY, WIDE3-2, WIDE3-1; that should be the same as RELAY,WIDE2-2 under the new WIDEn-N paradigm or RELAY,WIDE,WIDE under the old method. Note that WA4KJH-7 does to respond to WIDEn-N - only RELAY, WIDE and TRACE.

As for the digipeater aliases, you are running UI-View, correct? I think that can be configured to support WIDEn-N. In my opinion, supporting WIDEn-N in addition to RELAY and WIDE would be ideal.

Again, I'm not saying what you are doing is wrong, I just want to get some good discussion about what you have chosen.

Not a lot of logic, just trial and error :-).

I will probably go by and change it to APRS,RELAY,WIDE2-2.

How does it need to be setup for the old and new? Suggestions very much needed and wanted!

It does seem to be digied by WA4KJH-7, as I find it in the paths on FindU very often.

Anyway, suggestions / helps are in order! Want to make it right and good!

93. Hello

Yahoo group: EastTNAPRS
Date: 2005-06-21 15:37:20 UTC
From: Ben Sager
Topic: 93 Message: 93

Hello all,

My name is Ben Sager and my callsign is KC4ASF. I am retiring from the US Customs Service soon (now known as DHS/CBP) and with my wife will be moving to nice house on Tuckaleechee Pike within the next few months. It is located close to the Lambert's Golf Course. We are about a mile off of 321 East of Maryville. We have always liked Tennessee and was lucky enough to find a great house to buy. I am now waiting on my retirement papers to go through and then we are on our way South.

I am a General class ham and have always been into the digital modes, both HF and VHF for the entire time I have been licensed which is now 20 years. I have been a member of AF MARS (AFA2OS) for many years also and have been into the digital side with them as well.

I have experimented with various versions of APRS programs over the years and over the last couple of years I finally settled on UI-View. I still use WinAPRS on the laptop when I travel though, mainly because of all the maps built into it. I have also tied a Davis Vantage Pro weather system into the home system and broadcast the data collected to the internet as well. The weather and bird watching are something my wife and I both enjoy a lot.

I have only experimented with mobile APRS but I intend to put a TT-III into each of our two cars once we get to Tennessee.

I have been heavily involved in Emergency Communications in VA and held several positions in both the VA ARRL and AF MARS programs. These positions all dealt with the Digital issues in Emergency Communications. I developed and maintain a website www.kc4asf.org to provide information for the amateur community in VA on ECOM.

Again, we are looking forward to moving down and thanks for asking me to join your group. Oh, is there a voice repeater that most of you use in East Tennessee?

73
Ben Sager
KC4ASF/AFA2OS

==========

Va Digital Emergency Network (VDEN)

By using RELAY,WIDE3-2 (or RELAY,WIDE2-2), you are mixing the old aliases with the new.

My suggestion is to try RELAY,WIDE,WIDE for a while - and check your results.
Then switch to RELAY,WIDE2-2 for a while and check your results.
Then switch to WIDE1-1,WIDE2-2 for a while and check your results.

If nothing that I have proposed works as well as RELAY,WIDE3-2, then I would suggest that you revert to that setting...but, I suspect that either RELAY,WIDE,WIDE (maybe just RELAY,WIDE) will work best for you in our area at this point in time. However, you may have enough digi coverage south of you that support the new WIDEn-N that WIDE1-1,WIDE2-2 may work equally well or better - the only way to know is to try it. And by try it, I would change the setting and let it run for 24-48 hours or more.

As for the digipeater setup, remember that I'm not a UI-View expert, but here's my understanding. In UI-View, select Setup - Digipeater.

X Enable digi (I assume you have already done this).
X UI Only
X Alias substitution
X WIDEn-N
Aliases: KF4CFO-7,RELAY,WIDE
Sub Call: KF4CFO-7
Dupe secs: 15

With this setup, you support the old aliases of RELAY and WIDE, so that
UI-View32 hears a frame - G8MZX>CQ,RELAY*,WIDE
UI-View32 digipeats the frame, replacing WIDE with KF4CFO-7 -
G8MZX>CQ,RELAY*,KF4CFO-7*

And you support the new aliases of WIDEn-N, so that
UI-View32 hears a frame - G8MZX>CQ,WIDE4-4
UI-View32 digipeats the frame as - G8MZX>CQ,WIDE4-3
Another WIDEn-n digipeater hears the frame and digipeats it as - G8MZX>CQ,WIDE4-2

etc... When the SSID reaches 0, the digipeating stops. The first 'n' is the initial value of the SSID. The actual SSID counts down as each WIDEn-n digipeater digis the frame. The highest valid initial SSID is 7, although anything above 3 is generally discouraged.

To prevent a frame bouncing back and forth between two WIDEn-n digis, dupe suppression must be enabled if WIDEn-n is enabled.

Do you currently have WIDEn-N enabled? or just the one alias of WIDE2-2?

My biggest question is about maps. I have started using the SA Grabber program, but I find that to be very limited.

I'm too cheap to spend the money to buy PMap just to see if I would like it.

What other maps do you use with UI-View? And where do you find the plugins that you have described?

On Sat, June 18, 2005 1:16 am, WA4YYM@... said:

William, I was planning on bringing my equipment, but I have to mail it off before the weekend. I am attending GPSL on July 1 and need my equipment for use there. In order to get my equipment there in time before the event, I need to mail it up there so I don't have to carry it on the airplane. I can bring a TinyTrack if need be.

From: Scott
Topic: 81 Message: 97

In the digi, all the right boxes are checked. But I probably have to path way too long. I think it is KF4CFO-7,RELAY,WIDE2-2. I'll try to change it around. Only thing is it is a 20 minutes drive to do it! Bear with me...I want to get it right so it is useful.

I'm confused...if you have WIDEn-N enabled, you don't need WIDE2-2 listed in the digi box.

By the way, it is working and properly responding to RELAY. It digi'd WA4DAC just a little while ago (looks like they were running a path of RELAY,WIDE,WIDE) as they drove down I-75.

I too have set up UIVIEW to digipeat and I set mine to
WIDE1-1,WIDE2-2,WA4YYM with N-n checked. I wonder, since you posted the message above, if
the
WIDEN-n aliases need to be specified if the N-n box is checked. Right now, I
don't have RELAY,WIDE listed since they are trying to phase them out. I
e-mailed Bob Bruninga and he discouraged their use, saying that as long as we used

it that people would continue to use the old paradigm.

My concern is that in Cleveland, we are shadowed by the large hill that is on our western boder from W4LAW-3 digipeater over on Signal Mountain, about 20 miles west of us. I can certainly access it from my home QTH with a gain vertical antenna, even on low power, but around town and up I-75, I cannot get enough signal strength from W4LAW-3 to receive packets reliably and I cannot get enough signal from my TH-D7 with a 3 db gain magmount antenna to get into the digipeater. That is why I set up the digipeater here at home. Between Scott's digipeater and mine here, I think we can cover the valley pretty well between here and Knoxville along I-75. I am concerned about the duplication of packets and the possiblity of collisions though. I hear W4LAW-3 send out a packet and then mine sends out the same packet right behind it (or so it seems). I guess at some point the air will be filled with duplicate packets. A RELAY only digipeater would only allow access to mobile stations to gain access to the main digipeater, but not back to the mobile station, the way I understand it. Am I wrong? Again, the problem is both on the receive and transmit sides of the mobile station not getting access to the main digipeater (W4LAW-3).

Don
WA4YYM
Cleveland, TN

Welcome to the group, Ben. As you can see, this is a fairly new group, with some very knowledgable people, as well as rank beginners like myself. I was a Novice in 1962, and just recently returned to ham radio. I'm just getting started with UI-View, but have a feeling I'll be asking you down the road about your weather station setup, which is something I'd like to do down the road.
The repeater for emergency services in our county is 146.94... a good one which I can reach from the edge of the county with 5 watts handheld as well as my mobile rig. Skywarn brought me into all this, but several members of the group are into using APRS for high altitude balloon chases.
Again, welcome to Maryville.

Mel KI4JQP

I have seen your IGate doing a lot of work - to me, this indicates that it is in a needed location.

The use of WIDEn-N paths is supposed to cut down on duplicate packets; once everyone moves to it, dups should slow down. With your digi/IGate in place, people should also begin to reduce their UNPROTO paths, thus further eliminating dups. If you feel that you are not adding much value, then you may uncheck the WIDEn-N, and use the aliases of RELAY and WIDE1-1 (WIDE1-1 is what is being proposed to replace RELAY)

For your mobile situation, try a different path. I think you are only WIDE1-1,WIDE2-2, right? Your packets may be being heard by a digi that does not support the new paradigm. Try changing it to RELAY, WIDE2-2 or RELAY,WIDE,WIDE for a while and see if you get any better results.

A RELAY digi peater will repeat any packet that it receives with an undigi'd RELAY in the UNPROTOPATH. So, if a mobile station is near your home station and transmits something like:

KI4HDU-9>APRS,RELAY,WIDE...

then your home station will digi it as

KI4HDU-9>APRS,WA4YYM*,WIDE...

If W4LAW-3 hears it first, then the packet you will see will look like this:

KI4HDU-9>APRS,W4LAW-3*,WIDE...

Your home station (setup with an alias of RELAY, and without WIDEn-N support) will see the next unused step in the path is WIDE (not RELAY) and will not repeat the packet.

My home station is in a similar situation - it does not have a great antenna, but it does hear WA4KJH-7 very well, so I act as a RELAY (and WIDE1-1) digi and IGate.

I think the Ocoee Amateur Radio club (http://www.wd4oar.org/) is considering putting up a digi on a mountain to your East. You seem like you are in a good position to help them with the setup of a digi in this area - then your home station can be primarily an IGate and also a RELAY digi.

All-in-all, I'm seeing more digi's go up. At this point, we are not having any problems with too many packets on the air, so I think more digi's are a good thing; it's only a bad thing when their footprint is nearly the same.

Any of this make sense?

I understand now! I'm glad I "met up" with you guys during the first ballon launch this year, as I have learned, and am still learning a lot about APRS.

I am going to leave all the boxes mentioned checked, but change the ALIAS to "KF4CFO-7,RELAY,WIDE".

I believe the beacon path is OK.

Feel free to bring along a TinyTrack if you wish...I plan to bring my D700, a TT3 and an HT. I may also bring my Rascal box to demonstrate the soundcard interface.

I'm curious, what is GPSL?

106. KF4CFO-7 Update

Yahoo group: EastTNAPRS
Date: 2005-06-22 13:07:43 UTC
From: Scott
Topic: 106 Message: 106

Well, I think with William's help, we now have a good digi in Athens, TN!

I just did some tweaking to the digi settings according to William's suggestions, and I like what I am seeing.

The beacon setting is APRS,RELAY,WIDE2-2. This is getting it to the internet every time it beacons, and sometimes uses Don's WA4YYM, somtimes William's IGATE, and at times one in GA.

The digi is set for KF4CFO-7,RELAY,WIDE and has the WIDEn-N checked. What I am seeing is that it is digiing both the old and new types of settings. It is digiing stations from all directions into the area, and even on out if their path asks for it.

We had hoped to be able to use it also as an RF to Internet Gateway. However, their is no way (at least that I have found) in UI-VIEW32 to have the internet connection automatically reconnect if the connection is lost. What I do to keep UI-VIEW32 running is I have it in the Start Up folder and have to computer to automatically restart if it shuts down. At City Hall, at least once a week, the generator fires, which is enough to make a shut down happen. Anyway, Don's gate seems to be working very well, and if he can keep it going, our's probably won't be needed.

And while I have the mic...Don't forget our hamfest July16th at Athens Regional Park just of I-75 Exit 49. Check out www.qsl.net/kf4cfo and click the hamfest link!

I will probably show up at the FD site with my APRS setup. Garmin Street Pilot III, Buxcomm L/R, Laptop, IC706 Mobile, test yesterday to Oneida / Scott Count Airport, worked good, though packets were lost from I75 to 63 due to the mountians. Otherwise it worked very well, using UI-View 32, SA9, but will be on APRS+SA very soon. I like it better since you don't "have to " capture maps.
73 to all,
Rod K4RWH

From: William McKeehan
Topic: 106 Message: 110

Have a look at KC8YVF-10. He's over in Monroe county over near the NC border; his packets are being digi'd by KF4CFO-7. I think this is the first time that I have seen a station transmit a packet from this far east in Monroe County. I think you are doing a great job!

I think you have the key to the correct beacon path. Use what works. There are a number of possible alternatives, but if the one that you are using accomplishes what you want to accomplish (without undue abuse to the network - which I do not think your path is doing), then you have it right.

Getting UI-View to reconnect to an Internet feed must be possible; too many people use UI-View as an IGate for this to not be an option - this would be a good thing to ask on the UI-View messageboard.

Ben, I would agree with Mel, the balloon chases for utarc
(http://balloon.utarc.org) are what recently brought local interest to APRS.

Their first launch was the first balloon launch/chase that I had ever
participated in; I really enjoyed it.

Given your background with packet network knowledge, you may find it amusing
to read some of our recent posts about UNPROTO paths - and you may be able to
provide some clarification about points made in those posts.

I'm glad to have you as part of the group and look forward to your input.

112. Voice Repeaters in East TN

Yahoo group: EastTNAPRS
Date: 2005-06-22 13:19:56 UTC
From: William McKeehan
Topic: 93 Message: 112

There are a number of good repeaters in East TN.

By far, the two most heavily used are 146.85 and 146.94. Both of these machines cover a huge area - from Athens (some people can hit them from Chattanooga) to Crossville to Middlesboro to Greenville.

The 146.94 machine is the one used for SkyWarn nets and by the Blount County ARES group for their nets. The Knoxville RACK club (http://www.w4bbb.org) has a linked repeater system; 147.30 is the 2 meter one there. The SMARC club (http://smarc.homestead.com/) has a repeater in Maryville (or is it Alcoa) that is 146.655. There is also the 147.195 repeater in Seymour that has good coverage and is used a lot in the morning.

And this is just the 2 meter repeaters...we also have 6 meter, 1.25 meter and 70 cm repeaters that cover the area well.

113. Local APRS Usage analysis

Yahoo group: EastTNAPRS
Date: 2005-06-22 17:01:43 UTC
From: William McKeehan
Topic: 113 Message: 113

Some areas of the country have had problems with people that use excessively long UNPROTO paths. As a response to that, a group has written a little program that will monitor the packets heard at a particular station and generate a list of stations with the number of packets per hour/day in an effort to identify the frequency "Hogs".

In a test, I have started running this at my home station. You can see the results here updated every 1/2 hour:

Topic: 93 Message: 115

Thanks for the kind words Bill,

We are using WIDE2-2 max up here for bases and mobiles are using whatever it takes, within reason, for them to be reliability reported on the network. Relay still seems to get used by some mobiles as they travel I-95. I have relay and trace turned off on my setups. We use the station callsign to help out whenever we can. ID intervals run from 20-30 minutes for the bases while mobiles are about 1/2 that depending on where the mobil is going to be operating. We have been able to settle down our network quite well after some discussions and Bob Bruniga comes to Fredericksburg often to visit family. So he gets first hand views of what is happening with the network between here and his Maryland QTH. :)) Some folks are also adding a 100 hertz tone on mobil rigs setup on 144.39 which allows them to communicate verbally as needed without listening to the packet signal. Wives seem to really appreciate that tone!

I have watched some WV ballons with APRS and found that very interesting. I will checkout your links and also review the msgs of the past to see if I see something that could be clarified more...

I plan on mainly observing as you all seem to have leaders that can handle things as they come up. Of course I will answer questions or express an opinion when asked.

Overall, I see good things happening with APRS in East TN! You have some elmers, such as yourself and a couple others that helps newbies who want to learn. I have found that most people want to do it right and will follow local/national guidelines when they have someone to answer their questions politely and make suggestions so they can do it right! I also found so long ago that we all need training because we were not born with the knowledge of putting together a packet and/or APRS station. :)))

Take care!

Now that's just too cool. I like it though. I'm not on that list because I've been working on my APRS setup, so it's been disconnected. I want to be able to track, log and map everything on three different APRS frequencies, all at the same time. I will be chasing probably better than 10 different balloons using over 15 different APRS trackers at the Great Plains Super Lunch on July 2nd in Omaha, NE. They are dividing everyone up on three different frequencies, all using time slotting assignments. I want to be able to monitor everything from the car and see it all on one single APRS map.

Check out http://www.superlaunch.org/frequencies.html

From: William McKeehan
Topic: 118 Message: 118

If anyone is able to help out...KG4LMW, Stuart, is in the woods, trying to get a TH-D7 to work with APRS.

I can hear him talking about it on 146.85, but it's a little difficult for me to get back to him from Memphis (KI4HDU-7) :-)

He's not quite got things setup correctly, but I don't know what he's missing. Maybe someone there can contact him via voice and help him out.

Topic: 106 Message: 120

I saw the Monroe Co station today also. Tomorrow, hopefully, KC4OJS is going to take his Kenwwod HT and GPS with him, as he works building houses in the Tellico area. We'll see how that does.

Occasionally, you may see KC4OJS as an airplane. Kenny teaches flying, and sometimes when a student solos or does a cross country, Kenny drops the rig in the back seat of the airplane. Neat to track it!

I'm going to leave the setting as is for now. I think we are at the right combination. I am seeing good digi repeats for other stations, and very little "doubling".

Let me know if you'all see anything amiss. Right now, I don't run APRS here all the time, as I use the Yaesu FT-8800 for Voice, APRS, & Packet, but hope to get a dedicated digital rig for 2M soon.

73, NA4IT

By the way, is anybody else having a problem with the message screen here on Yahoo overlaping too far to the right? I have tried every resolution my monitor has and can't get it where I can see it.

Scott

Also the 145.310(-)141.3 WA4PNI machine covers from Knoxville to south Cleveland, and we have some upgrades, such as remote receivers planned for it to increase it's hearing. It is used for Skywarn for McMinn & Meigs Counties, and as a relay for the NWS to point South and West of here.

Well, according to Bob (APRS King) an APRS station "should" send out something every 10,20,30,60, minutes if it is a digi. Of course our software devices only do one beacon.

That said, I don't mind seeing a stationary station's beacon every 30 minutes. If some one is running a mobile cross country and not being tracked, probably every 15-30 would be OK. For something that is supposed to be "tracked" such as a ballon, airplane, bike ride, etc. probably every 1-15 minutes for that depending on lateral speed. And plane moves faster than a bike, so naturally it's beacon would need to be faster.

And that's my opinion...

In my opinion, ever minute or two seems appropriate WHILE mobile - but not while sitting still, but that's a decision for each station to make. As for seeing packets from SC/GA - that goes to show you 1) what effect a long path has on the network and 2) how big the ears are on WA4KJH-7 and 3) how well I can hear KF4OWQ-2 (in KY).

Did I mention that I'm only using an HT with a mag mount antenna?

Also something to consider...there was a huge band opening around here this morning. KF4CFO-7 was hearing stations DIRECT from 150 miles away...

Topic: 93 Message: 126

One thing that I would like to have for APRS is a map of repeaters. I have a few maps that have the rough locations of several repeaters in the area, but not precise locations. BTW, WA4KJH-7 is at the same location as the 146.85 repeater.

It's my understanding that you can do something like this easily with UI-View, using something they call overlays if my memory serves me correctly. Anyone have data with repeaters with their lat/lon ?

I guess this means that I don't need to check the reciever sensitivity on WA4KJH-7?? I really wasn't wanting to go up there and disturb the snakes.

As for 1 or 2 minute broadcasts being heard via a digi. That station might be mobile. Or they may be running APRS DOS and just started the software up. I don't know if it still does, but the versions I have of it start out with beacon interval of 1 minute and then increase over time to an interval of around 30 minutes.

A beacon rate of once every 5 minutes is what we used to run mobile, this was to ensure that the beacon might actually get into a digi at least once every 30 minutes.

Another cause might be that the station you are seeing is using UI: WIDE, WIDE, WIDE and what you are seeing is it bounce 2 times through the network and the time difference is the network latency.

I don't know about the sensitivity on WA4KJH-7.
It certainly hears well to the North - up to about Lake City
To the West, it does not quite cover Blount County,
To the South, it hears N4NEQ, thus giving us a hop over the moutain if necessary,
To the East...I'm not sure how far it goes that way I don't see much traffic
that direction until you go north.

One thing that I would like to see you add to WA4KJH-7 is support for a couple
more aliases if the TNC that you have up there would support it; WIDE1-1,
WIDE2-2 and WIDE2-1.

Bob has suggested a change to the nationwide network which includes dropping
support for RELAY and WIDE to be replaced by smart digi's using WIDEn-N. I
know the hardware at WA4KJH-7 will not support WIDEn-N, but if you support the
above aliases, then it would give at least one hop to a lot of the stations
that are switching to the new UNPROTO path - the suggested nationwide UNPROTO
path is currently WIDE2-2 or WIDE1-1,WIDE2-1 or WIDE1-1,WIDE2-2.

But I don't like snakes either, so I can understand if you don't want to
travel up there to make such a change :-)

I think the program needs a bit of work - one thing I want to do is have it show the packets that I received (and what makes the count come up to what it is) as opposed to what was logged at Findu.com. I'm also considering changing it to not count message packets. The good thing about this one is that it's written in Perl - something I can understand :-)

It looks like the GPSL will be a huge event! How many people do they generally have tracking the balloons? How many balloons will you try to locate? Do you just focus on one or do you watch everything and just try to get what you can?

On Wed, June 22, 2005 4:23 pm, David Hoffman said:

Topic: 130 Message: 130

I'll introduce myself, since I don't recognize many of you listed in the members directory. I own WA4KJH-7, it uses Keith's callsign since it is located at his site and he is able to look after it a little more than I can.

I also own N4QEA-2, yes this digi is down. Due to some changes at the site and need for other antenna's on a very short tower, the digi lost it's antenna space. The radio it used was a GE Master II and it's receiver hasn't been real happy since the move from 145.39 several years ago. I think it has a SINAD of about .65uV @ -12db. There is some talk from the group in Nashville about putting up another digi in the Cookeville/Montery area. This should work down I-40 better than N4QEA-2 ever did.

I started in APRS about 10 years ago after running the local packet BBS for several years. Back then there were no maps of TN and APRS DOS was the only game. So I built several of the first maps that were ever made for the state. I don't know if Bob is still using them with his DOS version or not. I've been inactive on APRS for about the last 4 years due to increased work levels.

The next APRS operator in East TN was Paul Drothler, he and I worked on several ideas and uses for APRS and both of us ran WX Stations and sent real time data to WX4MRX via APRS. We both ran trackers in the vehicles with mounted computers. Somewhere around here I still have my Micro-TNC and just recently found my Pico-packet TNC.

It is good to see some interest in APRS start springing up again in the area, and thanks to William for leting me know that he had started this list. I don't know who often I will get to check in and look around, but I will see if I can from time to time.

It's also great to hear that there is a Digi in the ATHENS area. N4QEA-2's original home was on Oswald Dome in Polk CO before being moved to the Crossville area. I'm curious where did you put the DIGI? Starr MTN???

Bill, I would love to add the extra aliases. But there is a problem. The TNC software does not support that format. The TNC is an MFJ-1270b. It is a TNC we used prior to using on APRS for the network we ran the BBS traffic across. I think we were running TheNET software back then on a specially burned Eprom's.

In order to add extra aliases I will have to purchase a new Kantronics TNC, unless someone else has enabled the aliases in their TNC firmware. The last I heard, they were the only ones. Before it gets suggested to put a computer on the MOUNTAIN and doing it that way, forget it..... Computers will not last at that site for any length of time. Whatever is put there has to be simple and rugged. Our best luck has always been with a simple TNC. In a disaster, simple is always the best.

As WA4KJH-7 sensitivity. I guess that one will require a new radio. I've already burned up 6 radio's over the years to Packet digi service. The commercial GE's are the only ones I have found that can hold up to the constant pounding they get. The downside is that they don't do well on the new APRS freq.

Subject: Re: [EastTNAPRS] Re: Local APRS Usage analysis

I don't know about the sensitivity on WA4KJH-7.
It certainly hears well to the North - up to about Lake City
To the West, it does not quite cover Blount County,
To the South, it hears N4NEQ, thus giving us a hop over the moutain if necessary,
To the East...I'm not sure how far it goes that way I don't see much traffic that direction until you go north.

One thing that I would like to see you add to WA4KJH-7 is support for a couple
more aliases if the TNC that you have up there would support it; WIDE1-1, WIDE2-2 and WIDE2-1.

Bob has suggested a change to the nationwide network which includes dropping support for RELAY and WIDE to be replaced by smart digi's using WIDEn-N. I know the hardware at WA4KJH-7 will not support WIDEn-N, but if you support the

above aliases, then it would give at least one hop to a lot of the stations
that are switching to the new UNPROTO path - the suggested nationwide
UNPROTO
path is currently WIDE2-2 or WIDE1-1,WIDE2-1 or WIDE1-1,WIDE2-2.

But I don't like snakes either, so I can understand if you don't want to
travel up there to make such a change :-)

John, you are not going to believe this, but the KF4CFO-7 digi is at Athens City Hall at the club station! We may look at putting one on David Fridley's home tower in Niota (he lives between I-75 and Hwy 11 and has a 160' tall tower right beside his house)!

Glad to be a working part of the APRS group. The KF4CFO-7 digi runs under the McMinn County Amateur Radio Club call, but I am the one to blame! hihi.

I figure that knowing the position of my digi is not that important to most people, so I have my beacon rate set to 60 mins (also that on my home and laptop stations).

I would point out that Bob Bruninga, WB4APR, is the creator of APRS. There are a number of people that believe Bob is a god - others think he's a crazy fellow :-) I think he's gets a lot of things correct, but misses the boat on some others, but overall his opinion is well worth listening to.

I think a mobile station can beacon more often than 10 minutes - but like you so well state...that's my opinion. One thing I like about the TinyTrak3 - it has a thing called Smart Beaconing - it will send a beacon when you make a turn or on a time basis - and the time changes as your speed increases.

On Wed, June 22, 2005 6:19 pm, Scott said:

135. Voice Repeater Locations

Yahoo group: EastTNAPRS
Date: 2005-06-23 02:12:40 UTC
From: Scott
Topic: 135 Message: 135

Well, MCMINN ARC is easy:

WA4PNI 145.310(-) at 3534.34N/08422.43W (Madisonville area)

KG4FZR 145.150(-), KG4FZR 147.060(-) & KF4CFO 442.275 (+) at
3527.87N/08435.96W (Athens area)

All our machines use 141.3 tone in. Some do tone out also.

If anybody wants a UI-VIEW overlay of these, I have it. The 3 at the
same location are offset just a little (0.10 +/- N-S) so they show up
individually on an Athens TN map at street level.

I respect Bob highly! He has done a great job with APRS. I do know that not every area can use a "generic" pattern of settings. What works here would probably flood Kansas! That's why all of us sharing ideas and suggestions in a setting like this group is SO important! That way we can have a great system in E TN.

That's a start! Thanks!

If you have an overlay file, you could put it in the Files section of this group - that way others may find it and use it.

You know guys, a map of all the ham repeater locations across the entire state of TN would be real helpful. Expecially if this was done as a Delorme map exported file. We have tried to gather the information up at the office but to date I don't think we have gotten much data out of SERA.

Early morning band openings are normal this time of year due to thermal ducting as the sun heats the upper atmosphere but still hasn't heated the lower parts. Wait until one of those 800 mile openings happen.

This web site:
http://mountainlake.k12.mn.us/ham/aprs/path.cgi?map=na
uses APRS-IS data to identify such band openings; although it can sometimes be missleading, it's kinda interesting.

146. Re: [EastTNAPRS] Re: Voice Repeaters in East TN

Yahoo group: EastTNAPRS
Date: 2005-06-23 13:29:27 UTC
From: William McKeehan
Topic: 93 Message: 146

I agree. I have a few paper maps with repeater locations on them:

http://www.mtsh.org/Images/mtearsmap.gif
http://www.metersinc.org/library/e_tn_2m.gif
http://www.metersinc.org/library/c_tn_2m.gif
http://www.metersinc.org/library/n_ga_2m.gif

But I don't have specific locations for each of the repeaters.

Idealy, I would like to have lat/lon and PHG of the repeater so I could put them on my APRS map AND see their potential range.

I can't find any similar maps for West TN, Northern Alabama, Northern Mississippi, Kentucky, North Carolina, South Carolina or Virginia. All of which I would love to have.

On Thu, June 23, 2005 8:56 am, John Moyers said:
> You know guys, a map of all the ham repeater locations across the entire

From: Scott
Topic: 148 Message: 149

Matt,
Toss WinAPRS and get UI-VIEW32
(http://www.apritch.myby.co.uk/uiv32.htm). It is "free", but you have
to register it. The author of the software passed away last year, but
his family and friends make it available for the promise that you will
make a donation to cancer research.

Then, if you can get a copy of Delorme Street Atlas (no higher than
version 9) and you will be set.

There are also a couple of add on's you might want. One is UI-Terra,
which allows you to download maps off the Terra Server website ready to
use, according to your specifications.

Also, if you are into Skywarn, download UI-RADAR. It will allow you to
use a auto refreshed radar screen as your map.

I am going to place some links in the links folder to this stuff. Also,
I will place a copy of both the NWS Huntsville Radar image and ini
file, as well as the NWS Morritown files into the files section of the
group.

If you need help, come back here. We'll help you get it set up.

150. Added files and links for UI-VIEW32

Yahoo group: EastTNAPRS
Date: 2005-06-23 15:56:09 UTC
From: Scott
Topic: 150 Message: 150

Hey folks, I just added some neat stuff for the UI-VIEW32 users here.

(1) In the LINKS you will find links for UI-Terra (used to download Terra Server maps) and UI-RADAR (Used to refresh NWS radar images used as maps).

(2) In the "FILES" you will find the radar map images and ini files for the NWS HyTop AL and Morristown TN radar. BE SURE TO READ THE READ ME FILE!

Enjoy!

151. UI-View map usage questions

Yahoo group: EastTNAPRS
Date: 2005-06-23 16:05:39 UTC
From: William McKeehan
Topic: 148 Message: 151

With UI-View, I have the UI-Radar plugin up and working (thanks for the .inf files!).

What I would like to do is zoom in and move around that map...but I can't figure out how to do it. Am I missing something or is this just not something that you can do with UI-View

Topic: 148 Message: 152

That's the only thing I don't like about UI-VIEW, it is hard to zoom or move an entire map. But, you can go to a point you would like to zoom with your mouse, hold the "SHIFT" key down, left click and drag a circle out a little, let off and it becomes a zoom window. Right click it, and you can change it to a square, or close it.

Yahoo group: EastTNAPRS
Date: 2005-06-23 16:13:54 UTC
From: Scott
Topic: 148 Message: 153

One other thing on the NWS radars, the ini file is very close on positions, but, NWS radar maps are tilted ever so slightly, so it is not exact. A station close to the edges may not appear exactly where the are supposed to be, but they will be close enough.

I wanted to use the new "RIDGE" radars, but the are so tilted, it is impossible to get the lat & lon right to show anthing even anywhere close except the center point.

From: William McKeehan
Topic: 106 Message: 154

I started up UI-View today after not having it running for a couple of days. I'm in an office where the firewall will not let me connect to the APRS-IS server, and what I noticed was that UI-View was trying to connect to a server (it failed, but it kept trying).

Looking at my "Setup - APRS Server Setup" screen, I see an option (that I have checked) "Enable auto reconnect"

Have you tried to enable this?

That setting plus Max Silence looks like it should do what you need done.

I have auto connect/reconnect turned on and I think my
max silence period is set for 3 minutes.. I have mine
setup so that it only gets the Eastern part of the
country on UI-View. I have only 2 destinations
servers setup which seems to work very well. It makes
it through both my firewalls since I told them to
allow it.

I use Xastir - it is free, but not as easy as some others.
http://www.xastir.org

On a world-wide level, the most popular software is UI-View.
http://www.ui-view.org

In our little group, APRS+SA is very popular.
http://www.tapr.org/~kh2z/aprsplus/

Then, there are the Internet solutions:
http://www.findu.com
http://www.jfindu.net

If you look at some of the earlier messages in the group you will see some
discussion about these various tools.

The problem we have is that the power actually fails for a minute when the emergency generator starts at city hall. The software itself restarts with no problem, but you have to actually connect manually to the APRS server for the reconnect feature to work.

To: "William McKeehan" <mckeehan@...>

Hello William,

Yes we run an APRS checkin concurrently with our weekly voice net for the West Panhandle District Emergency Net. It simply allows participants the opportunity to keep fresh on the program and not just stick it away until an emergency arises. The Net control on the voice net usually asks if there is an APRS liason who can take the checkins and if there is, that station posts a bulletin directing APRS users to check in. At the end of the regular roll call on the voice net, the Net control then recognizes the APRS liason and receives the callsigns of those who checked in digitally. This demonstrates the ability of APRS to handle background traffic while a controlled net is in progress. We have used APRS for command and control this way during our hurricane activations which keeps the voice frequency free of congestion. I hope this answers your questions and I will be glad to help with any other queries in the future. Good luck.

73,
Hank Holt
KS4NY

Have you thought about putting that computer on a UPS? You wouldn't need a large one, just big enough to hold during generator crank and it coming up to speed.

166. Re: KF4CFO-7 Update

Yahoo group: EastTNAPRS
Date: 2005-06-24 15:31:05 UTC
From: Scott
Topic: 106 Message: 166

We have thought of that, and may do it. The IT guys at city hall is on vacation, and it will be a couple of weeks before the internt is hooked up. We'll see what we can do. Right now, WA4YYM and KI4HDU are doing a good job getting stations into the APRS internet servers.

167. APRS/CE ?

Yahoo group: EastTNAPRS
Date: 2005-06-24 19:55:07 UTC
From: William McKeehan
Topic: 167 Message: 167

Has anyone used APRS/CE ?

KI4BXG has a GPS, a Radio and a PocketPC. He would like to get going on APRS. I would like to give him some advice, but I've never worked with APRS/CE.

177. APRS server disconnects

Yahoo group: EastTNAPRS

From: "Scott" <na4it@...>
Subject: Re: KF4CFO-7 Update

The problem we have is that the power actually fails for a minute
when the emergency generator starts at city hall. The software itself
restarts with no problem, but you have to actually connect manually
to the APRS server for the reconnect feature to work.

Would a simple UPS not cover the brief down time so the program didn't have
to shut down? Is that not what the reconnect box is for, along with perhaps
an alternate choice for a server?

EastTNAPRS@yahoogroups.com writes:

Date: Thu, 23 Jun 2005 12:05:39 -0400 (EDT)
From: "William McKeehan" <mckeehan@...>
Subject: UI-View map usage questions

With UI-View, I have the UI-Radar plugin up and working (thanks for the .inf
files!).

What I would like to do is zoom in and move around that map...but I can't
figure out how to do it. Am I missing something or is this just not something
that you can do with UI-View

William,
I believe I saw somewhere that you are using Precision Mapping v.5 with
your UIView. That is exactly what I am using here. I assume you have
downloaded the correct PMAP server to use with it. If you have not it is available
at _http://www.apritch.myby.co.uk/uiview_software.htm_
(http://www.apritch.myby.co.uk/uiview_software.htm)
and click on "v5 download" Read the information files also. With that
loaded and registered (free), as well as a registered version of Precisiion
mapping v.5 (let me know if you have not registered and I will tell you how) then
you can select "Precision Mapping from your maps selector and with the disk
in the drive you can zoom and pan anywhere you like. You need to enable
"alternative mouse controls" under "options." When the cursor nears the edge you
can click Ctl-and one of the mouse buttons(can't remember which one) and it
will pan. Ctl-double left (right?) click will center the map on the clicked
point, left click on the horizontal arrow on the toolbar on the left will
zoom out and right click on the horizontal arrows on the toolbar will zoom in.
I think I have it right. I'm not sitting in front of the program at the
moment. There is a help file somewhere on this. Try going to "maps", "control
panel", hitting F1 or maybe there is a help at the top of it (control panel).
This is the only program I have found which will also follow you mobile and
auto-scroll to the map you are currently positioned in. Helps to enable
tracking and also "crosshairs" in the GPS setup. I also use SA version 7 but it
does not pan and zoom or auto-scroll. If you need more help---holler! The
UIView Yahoo group is outstanding.

The way IGates work - the first IGate to hear a stations packet will put it on the net.

While NA4IT and KI4HDU-2 probably heard th packets from KC4OJS, they heard it after WA4YYM (who generally heard him direct). So WA4YYM put most of the packets on the internet.

In my opinion, this goes to show that you can not have too many IGates. It may be possible to have to many digi's maybe - if they have the same coverage area, they would just beacon on top of each other or send duplicate packets.

So if you are considering putting up an IGate, I say go for it! And if you want to make it a RELAY (and WIDE1-1) digi in the process, that would generally be a good thing too.

NOTE: The setting up a digi to respond to RELAY and WIDE1-1 is designed to help lower powered stations get to a biger digi (WIDE or WIDEn-N) - thus the name "relay". Stations are only supposed to put RELAY as the first item in their UNPROTO path, so the only stations that you will digi are the ones that you hear directly.

181. Field Day

Yahoo group: EastTNAPRS
Date: 2005-06-26 19:23:15 UTC
From: William McKeehan
Topic: 181 Message: 181

Field day gave me the opportunity to do some more playing with APRS.

I was in south Blount County at "Shorty's Lake" with the Smoky Mountain Amateur Radio Club.

Around 2:00, I got my stuff out of the car and setup my laptop and D700 on a picknic table. I tossed my mag mount antenna on the top of the pavilion.

KE4FGW was there with a TinyTrak2 that he had built. He had it beaconing with an Alinco HT (350mW I believe).

I had my TT3 there and at one point (to demonstrate) I connected it to KI4BXG's GPS that he had in his vehicle with my VX-5R HT.

As you would probably expect, I started up Xastir.

KE4FGW uses APRS+SA - I have that installed on my laptop, but never had much success with it. So while I had KE4FGW there, I started up APRS+SA and had KE4FGW show me some of the basics in it. It has some really nice features that I have not seen in other APRS program. Once you play with it and understand the tabbed interface, it gets easier to use.

I did not hear any digi's but I did hear a few "local" stations. I heard K4RWH's mobile station and WA4BDS's home station and KG4GUL-4's home station.

Roy, WA4BDS and Rod, K4RWH both live pretty close to the field day location and are members of SMARC, so I worked with them to do a demonstration.

The three of us communicated on a 2 meter simplex frequency (even here, I could only hear broken transmissioins from K4RWH) to coordinate. We were able to get WA4BDS setup as a digipeater. He first tried with APRS+SA, but had trouble getting it to digi. Aparently, that requires on the attached TNC to do the diging. WA4BDS was using KISS/PE and AGWPE. We could not figure out how to get this setup to digi.

WA4BDS shutdown APRS+SA and KISS/PE and started up UI-View32. K4RWH worked with him to get his digipeter settings entered in UI-View correctly and before long, I was seeing more stations on my map - I think the most that I had on my list was 18 stations.

With WA4BDS acting as a digipeater, I was able to send a message to and receive a message from K4RWH. It took a while - it was between 3 and 3:30 that we finally managed to get a message through.

One thing that came from this was the obvious fact that I need to invest in a portable antenna. After the demonstration, I stopped by WA4BDS's house where he showed me a few of his portable antenna setups - look for me to have one of these at my next event.

All-in-all, I think we all learned a bit more about our setups and how to set them up to help get the message out a little further.

182. 2005 MS Bike Tour

The Mayfield Dairy Farms "Scenic Mountain Challenge" MS Bike Tour is a great opportunity to use APRS and demonstrate how valuable it can be at events like this.

Web Site: www.msmidsouth.org
Tour Dates: August 27 & 28, 2005
Length of Tour: 150 miles
Start Location: Mayfield Dairy Farms, Athens, TN

Does anyone know who is coordinating communications for the ride this year?

I just wanted to share this with you. When I talked with Bill, I did tell him that several folks at field day heard this 30mW CW transmitter as well. This is just like the low power transmitter that I built for the UTARC balloons. Hopefully we'll get to try it out on their next flight.

David Hoffman - KE4FGW

ke4fgw@...

The 30 milliwatt FM transmitter was heard as far away as Champaign, IL - 370 miles (KA9SZX), Cincinnati, Ohio (W8ZCF), Knoxville TN (KE4FGW) as well as several other reports from Kentucky, TN and AL.

The balloon made it up to approximately 106,000 feet and landed near Wheeler Dam about 5 miles east of Florence, AL. It landed 1.44 miles north of my predicted landing site (unfortunately, I didn't have access to email when I did the prediction at the launchsite - Guess I'll have to get a Blackberry).

Jason KG4WSV and myself tracked it and after spending over 2 hours wandering the backroads, we finally got close enough to hear the signals....we had to be within 2 miles of it since it was sitting in a cotton field in a dip in the terrain. We were just about to give up when I heard a very faint change in the noise as I was heading home and went to investigate it.

I had the payloads on display at the Eva AL Radio Club's Field Day site.

The beacon was attached to an Ozonesonde and I will bring it for show and tell to the GPSL conference in Omaha.

Well, I ain't da chief, but Charlie Wheaton KJ4RC of Chattanooga contacted me about a month ago to see if the McMinn ARC club was going to be invilved, which we are. We also plan to furnish our MCT for the event. Also, I contacted Charlie Satterfield K4EZK of Monroe County, and they have some guys that want to be involved. So sounds like everyone needs to get their heads together and see what we can do. I don't think it will be any problam to run APRS out of the trailer, as i plan to furnish a desltop computer, TNC, and my handie talkie, unless I can get a mobile I can use for higher power. Also, we have had a little discussion as to where the MCT needs to be, some say mid point both days, some say end points both days. Ideas?

Also, they used the 145.310 machine last year (when it was on it's last leg) for McMinn & Monroe counties, and it is available this year (with a NEW machine). It is located in Madisonville TN on Hiwassee ridge behind the college (where the fire tower is).

I only worked one day of the event last year, but if I remember correctly, there was not a repeater that was able to cover the entire route. Net control was setup as Union Grove Baptist Church which is just off of Hwy 72 right after you pass in to Blount County. I think this was about the mid point. They had two radio's running - on on the 145.310 repeater and the other on the 146.94 repeater. They do have commercial power available at the pavilion at this church.

If anyone ran the event last year and happens to have a GPS track of the route, I would like to get my hands on it.

Moe, N4QCW, ran net control on Saturday morning...then Hal, WB4E, picked it up when Moe had to leave; I'm not sure what happened on Sunday.

I have found digipeter coverage to be poor on the south/west end of the route.

Given that I have not talked to the guy in charge, I'm probably not the guy to be making these decisions, but...I would like to see us get a trackers in the lead vehicle (Tom, KE4WFJ was the lead runner last year and he does have APRS), the sweeping sag (the last vehicle), and as many more SAG's/Ambulance/Mechanic's vehicles as possible. To support these, I think we will need to add some digi's along the route - maybe at the rest stops. To do this properly, someone would need to do some analysis of the current coverage and identify and test potential digi locations.

I have also written a little adjunct program for use with Xastir that will let me easily put and move objects on a map using predetermined points (thus my need for the GPS track to identify points along the route), so this could be used to keep track of the stations that do not have APRS capabilities.

Does anyone have any time this month to do some investigation of digi coverage along the route? I would like to see how well the route is covered with a 5 watt HT. My schedule for July is already very busy, so I don't think I would have time to do any pre-run type work.

William, you are correct, it did take both repeaters. And even with the new 145.310, it still may take both. I may try to go up there and see how much of the route I can remember and see how APRS does. We can setup the MCT with a digipeater as well as being able to monitor APRS right there. We have a 30 ft mast that goes right on the side of the trailer, and a 2M vertical can be put on it. The MCT has it's own dual band antennas on the roof, and they should adequate for the voice work.

One thing that has been mentioned to me, is the MS folks have asked that we do not follow riders this year. Some of the riders felt uncomfortable with that, so probably we will need to space fplks out on the route and have them sit and watch. And I do think having stationary units at the rest stops is a must.

I have email all the info I have already sent here to Charlie Wheaton who kind of spear heads this thing. The route is not available yet, and like I said, I'll have to guess my way through last year's route.

I have last year's queue sheet with the turn by turn directions on it if it will help. I won't mind testing out digis and APRS coverage along parts of the route towards this end. It will have to be in July though. I just saw that this queue sheet is only for Saturday's route. Not sure where Sunday's went but propably is this same route in reverse.

From: William McKeehan
Topic: 190 Message: 190

You can see a good shot of Shorty's Lake and the location where I was operating at on the FindU web site with this link:

http://www.findu.com/cgi-bin/find.cgi?call=KI4HDU-5&terra=1

Scroll down to see the aerial photo.

Cool, now that SSID of 5 just happened to be the time we used APRS+SA, correct?

Now I noticed that my TinyTraker (KE4FGW) didn't make it to findu from the field day sight. Does this mean that you were not a digi during that day? I doubt I would have made it to WA4BDS on 150mW. Then again, I don?t think he became a digi until later in the day. If you were a digi that day, then I wonder why I wasn?t digi?ed?

193. Re: 2005 MS Bike Tour

Yahoo group: EastTNAPRS
Date: 2005-06-28 19:15:15 UTC
From: Scott
Topic: 182 Message: 193

If you could email me a copy of that sheet, that would be great. The route back was almost the same, with one road different, and for APRS it isn't going to make that much difference. I don't know when I'll go up on the route, but if you will take a look at Blount Co, I get McMinn & Meigs.

Kevin, KF4YMC had an idea also for digis during the ride...have a setting of MSn-n, so that way we would only get the units involved in the ride, and could even go to MS7-7 if need be. (Might be better to do BIKEn-n...MS is probably Mississippi!)

I do not think I had the digi enabled on any of my setups that I ran that day,
so that would explain it.

From: William McKeehan
Topic: 190 Message: 199

One thing to note, the path that you had in your TT would have been long enough to get you to an IGate if my station was acting as a digi.

You were using RELAY,WIDE,WIDE

So the packet would have come out like this:
KE4FGW>APRS,RELAY,WIDE,WIDE.....
then out of my digi
KE4FGW>APRS,KI4HDU-X*,WIDE,WIDE.....
then out to WA4BDS and out
KE4FGW>APRS,KI4HDU-X*,WA4BDS*,WIDE.....
then out wider and probably heard by WA4KJH-7 and out like this:
KE4FGW>APRS,KI4HDU-X*,WA4BDS*,WA4KJH-7.....

which I would have had a good chance of hearing at my IGate, KI4HDU-2.

For those of you not involved, my station was the only station that could hear KE4FGW's tracker; WA4BDS was the only station that could hear my station, KI4HDU-7(-5). WA4BDS had a better location and antenna (and was running 40 watts), so he could be heard by even more stations and WA4KJH-7 is at 4500+ feet, so he listens well.

Does this help anyone else understand the function of a path any better?

200. Re: [EastTNAPRS] Re: 2005 MS Bike Tour

Yahoo group: EastTNAPRS
Date: 2005-06-28 19:54:03 UTC
From: William McKeehan
Topic: 182 Message: 200

The only issue I would have with using the MSn-n or BIKEn-n alias is that only the digi's that we setup specifically for the event would digi the signals.

This would be easy to do with a TNC that understands the n-n method, but I don't know how to set it up in UI-View or APRS+SA; it's not possible with Xastir (I could do it with some other Linux software) and I think the D700's have a problem with digi'ng the n-n method.

I think we would be best off to set the trackers to RELAY,WIDE,WIDE; set our portable digi's to respond to RELAY and WIDE.

Unless WA4KJH-7 get's an update to support WIDEn-N, then I think a WIDE3-3 with our digi's responging to WIDEn-N; I need to do some research with the D700 to see what the issue is with it acting as a WIDEn-N digi.

Whatever we use, we need to coordinate it well so our digi's (and hopefully the existing digi's) will digipete our trackers beacons.

Could be a problem with all the different softwares. Kevin did try
a "TN2-2" setting for a while, and it did infact keep him "inside"
Tennessee with a 2-2 digipeat.

Is Kevin on this list?

What was Kevin's location during the time he tried the TN2-2 setting?

Any ideas which digi's support the TNn-n? Does WA4KJH-7 support TNn-n?

On Wed, June 29, 2005 8:36 am, Scott said:

I think Kevin is on the list. He is KF4YMC just NW of Niota TN. I'll send him an email and ask him to explain his results. I do know that setting did not put him to the internet.

204. TN N-n

Yahoo group: EastTNAPRS
Date: 2005-06-30 05:26:26 UTC
From: kf4ymc
Topic: 204 Message: 204

Just checked FindU.comm and found this:
findU: Position of KF4YMC
9.5 miles northeast of Athens, TN --- Report received 11 minutes 43 seconds ago
Status: 300429zUsing TN2-2
Raw packet: KF4YMC>APU25N,TN2-2,qAO,WA4YYM:=/

I made the internet with appx.18 watts on a J-Pole(20' height)
I'm using UIView w/AGW Packet Engine. What I call the poor mans way.
I can not tell you if I made in outside Tennessee, I really don't know how to check that out.

I first went to using TN2-2 just for the fact it would keep me local.
I previously was using relay,wide,wide...
Who knows where that ended up at...All I really want to do is, be able to communicate, via radio, primarly local
(within my direct range). I really don't care if I hit an I-gate.

I don't have the slightest idea if any digipeaters around here support TN N-n
WA4KJH-7 suports TN, but if that is the same as TN N-n I do not know.
(PHG5860/W-R-T-TN ON COVE MTN @4175 FEET)

Sorry I couldn't tell you all more, but I'm just starting out in digitial modes, so my knowledge is severly limited to what I read.

In a recent showdowns, veteran Morse coders were able to send SMS messages faster via Morse than thumb-typists.

This article:
http://www.oreillynet.com/pub/wlg/7016
on O'Reilly Network floats the idea of using Morse code to compose text messages, as well as tapping commands (i.e. answer call, forward to voice mail, etc) in hands-free mode by tapping on the handset case.

Taken from Slashdot.

208. APRS expirementation "Net"?

Yahoo group: EastTNAPRS
Date: 2005-06-30 16:58:31 UTC
From: William McKeehan
Topic: 208 Message: 208

I was thinking about setting up a time for all of us to get to gether on the air to discuss, coordinate and test settings. I'm thinking about a voice net via one of the VHF repeaters (maybe 146.94) in addition to using APRS.

For example, I would like to see what happens when I use a path of TN2-2 or a path of WIDE2-2 or whatever. To really understand what is happening, we would need operators monitoring their stations to tell us what they are seeing.

Does this sound like something interesting to anyone else?

I'm thinking about doing this as a once-in-a-while thing, not a weekly or even monthly scheduled event (although running a weekly/monthly APRS net may be worth investigating).

From: William McKeehan
Topic: 204 Message: 210

The packet that made it the internet made it because it was heard directly by WA4YYM.

After that, there's no way to look at the internet to see what happened to the packet; the APRS-IS is designed to only accept and log the first packet that makes it to the internet to reduce the bandwidth consumption on the internet. This has both positive and negative impact; the negative is that you can't use the internet to do any real analysis of packet travel; the positive is that you can have as many RF->Internet IGates as you want without overloading the system.

Any digi operators that can, check your logs to see if you see any packets from KF4YMC; I'd like to see where this path is taking his packets. I'm not seeing any packets from him at my home station KI4HDU-2.

212. New poll for EastTNAPRS

Yahoo group: EastTNAPRS
Date: 2005-06-30 22:35:42 UTC
From: EastTNAPRS@yahoogroups.com
Topic: 212 Message: 212

Enter your vote today! A new poll has been created for the
EastTNAPRS group:

Would you participate in an East TN APRS Expirementation Net
on Thursday, July 7, 2005 at 9:30 PM (or as soon thereafter
as the Blount County ARES net ends) on the 146.94 repeater?

o Yes - I'd love to do it.
o Sure - I'll do it
o Not sure
o Pick another date
o Not interested

To vote, please visit the following web page:
http://groups.yahoo.com/group/EastTNAPRS/surveys?id=1239427

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

219. Coverage in Deal's Gap

Yahoo group: EastTNAPRS
Date: 2005-07-01 22:24:02 UTC
From: Jim
Topic: 219 Message: 219

Hi, I'm new to the group and appreciate all the work that has gone into pulling all of this information together. Thanks!

I'm a member of a car club that takes trips through Deal's Gap on 129, the Cherohala and surrounding areas fairly often. I've gotten very interested in APRS and I'm trying to convince a few of my car buddies to get their Ham license so we can keep better track of each other. Some of these events can have over a hundred cars and it gets a bit out of hand.

How is the coverage in these areas? Would we be able to get fairly frequent position reports? Could we do it with something like a Pocket tracker or would it take 50 watt mobiles? (Or is it just not doable?) Another area I'd like to understand is the voice repeater coverage on the portion of 129 called "The Tail of the Dragon." This is the Deal's Gap area and there is no cell phone coverage. It is a popular area for bikers and more than once we have come up on a wreck where a motorcycle is down, off the road and the rider is hurt. Someone has to drive into cell phone range to report it before the emergency response vehicles even start to roll. Is coverage good enough in this area that I could count on it for emergency response? Which repeater(s) would you recommend?

Sorry for all the questions but I am a new Ham (May 31st) and haven't had a chance to visit the area with my rig yet so I haven't been able to experiment.

Your best 2M repeater coverage in that area is probably 34/94. or 146.94. Tim may own it but to some of us it will always be George's Machine, and Tim understands.

I've not looked at the location of digi's lately, but the topography of this area is going to be a problem. It almost takes a digi on every ridge top to fully cover it for HT power levels. At 50 watts you might get lucky and bounce a signal off of a mountain and back to digi.

Frequent position reports. hmmm

Where would you like to receive those reports? On the internet - then you probably have a challenge. But if you have two stations that are in simplex range of each other, then they will be able to get position reports between the two of them.

It has been my experience that the digi coverage is not very good on the South-West side of Blount County, but I have not been down that way much since KF4CFO came on-line and the Dragon is between WA4KJH-7 and KF4CFO-7.

WA4BDS also has a potential digi at his house - he does not run it all the time, but could probably be talked into running it for an event if it would help. I don't know how many mountains are between you and WA4BDS, so I don't know if that would help or not, but it would be worth a try.

So I think I've told you exactly....nothing more then you knew before you asked the question.

Anyone else have any experience with coverage in that area? Anyone driven it recently?

Thanks, I'll try these out with both mobile and HT next time I'm
there. I'll be KI4KKD if you hear me.

From: Jim
Topic: 219 Message: 223

Actually you're helping me think this through. ;)

Internet gateing would be "real cool" and would have some use for people at the event hotel to be able to talk folks in and keep track of people coming in from runs to time the evening events.

But, tactical tracking by group leaders is more importaint and the occasional digi would help there when simplex couldn't get around the next hill.

So, sounds like spotty coverage with one addtional digi we may be able to request during an event. But, no one has made this run recently so I need to do a survey.

Again, I'm new at this so let me know if I've missed something.

Thanks!

Yeah, I think it will take them a long time to eliminate support for RELAY and WIDE in most places, but there are places where it's gone - Memphis for example.

Good luck in the chase!

I was down that direction today. I was on the motorcycle, so I did not have my D700, but my TT3 and a 5 watt HT.

I went to my parents which is near Union Grove - somewhere in the neighborhood of:N35 35.288' W84 08.037' From there, I took HWY 72 over to 129 - around the Pumpkin Center area and went North on 129 to Old Niles Ferry, then on to Maryville.

Looking at my track, I got no coverage below the 411/129 split. With the HT, I only had spotty coverage between there and home, so I'm not sure exactly what this tells us.

227. WX4MRX is updating

Yahoo group: EastTNAPRS
Date: 2005-07-02 23:17:11 UTC
From: William McKeehan
Topic: 227 Message: 227

I had a brief chatting session with WX4MRX today. They are looking at software to replace APRSDos. They are looking for something that will do bulletins (Xastir does not currently support sending bulletins) and has a nice point-and-click interface. Good maps would be a plus also.

They were trying APRS+SA today, but did not have much luck - I don't know all of the details. They were going to try UI-View32.

Some great news about this new setup - once they get the new software up and working, they are going to enable the digipeater. This should give great coverage in the Morristown area (this may have helped with the first balloon chase too).

They may join this group soon. I told them about it and asked them to join.

228. Thank U for approval and good to meet all of U de N4UBK

Hello,
Name is Bob,
Moved to Signal Mountain on 24 of June.
Using UI-View and Kenwood TM-D700.
I have UI-View setup as IP using broadband.
Glad to get out of Florida heat !!
Using APRS,WIDE2-2 at 10 Watts.
DIGI ON.
It will take sometime to find my way around here with car.
GPS only helps so much.
My E-Mail is : highfreqtube@ hotmail.com
I and my wife Sharon love it here so far.
Is there a VHF/UHF repeater that APRS'ers hang out on ??
Anyway looking forward to having many good QSO's with all of the group.
73's and God bless

Welcome to our little group!

You are a bit out of repeater range for the repeaters that I talk on - 146.94 and 146.85, both in the Knoxville area, but with wide coverage - you may be able to talk on them if you are in a high area.

You have a strong digi, W4LAW-3 in your area; I believe he will respond to WIDEn-N and there is another IGate a bit East of you, WA4YYM. Just up the road in McMinn CO is NA4IT; he setup the KF4CFO-7 digi which helps a lot with traffic on I-75 and in the Athens area.

The comment about support for WIDEn-N is because further up around Knoxville, it is currently not supported by the big digi, WA4KJH-7, so if you come up to that area, you will probably want to use a path of RELAY,WIDE or WIDE to get digi'd.

Looking at the map, I'm not sure if a WIDE digi is necessary in the area where you are, but you can never have too many IGates.

Again, welcome to the group - feel free to jump in and chat about anything APRS related.

I have placed an entire page, "APRS Paths and Digipeating 101" discussing these issue on my website, along with an animated GIF graphic demonstrating the digipeating process. This page should (hopefully!) answer many questions that keep arising on this list about the mysteries of APRS path settings.

For the text essay (which links to the graphic):

232. APRS NET Pole

Yahoo group: EastTNAPRS
Date: 2005-07-03 02:22:23 UTC
From: William McKeehan
Topic: 232 Message: 232

Well, our group is growing. We have 24 members now and have been growing over the past few weeks.

I want to ask everyone to take a few mins to respond to the current Poll http://groups.yahoo.com/group/EastTNAPRS/surveys?id=1239427

So far, 5 members have responded; I would like to get everyone's input on this one.

We are considering an "East TN APRS Expirementation Net." The current date/time is Thursday, July 7, 2005 at 9:30 PM (or as soon thereafter as the Blount County ARES net ends) with a voice net on the 146.94 repeater (assuming we get permission). Response options are:
Yes - I'd love to do it.
Sure - I'll do it
Not sure
Pick another date
Not interested

The poll closes on Monday, the 4th; we'll make a decision on Tuesday morning.

Thanks!

234. RE: [EastTNAPRS] Packet Path [Long Message]

Yahoo group: EastTNAPRS
Date: 2005-07-03 03:12:18 UTC
From: William McKeehan
Topic: 228 Message: 234

That path is rather interesting.

The way a path works is pretty simple, but hard to understand until it is explained. For me, explaination by example is easiest to understand, so let's give this a try.

In it's most simplistic form, a path is a list of digi's that you want your your packet to travel thru. Let's assume that:
W4LAW-3 can hear your station;
KF4CFO-7 can hear W4LAW;
WA4KJH-7 can hear KF4CFO-7; and
KI4HDU-7 can hear WA4KJH-7.

EXAMPLE 1:
Then let's say you want to get a message to KI4HDU-7 via RF, you could use a path like:

W4LAW-3,KF4CFO-7,WA4KJY-7

That would route the packet to W4LAW-3. WA4LAW-3 would hear and then repeat (digi) your packet, then KF4CFO-7 would digi your packet, then WA4KJH-7 would digi your packet and finally, I would receive your packet. If you were able to hear all of these packets on RF, it would look something like this:

N4UBK>APRS,W4LAW-3,KF4CFO-7,WA4KJY-7::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,W4LAW-3*,KF4CFO-7,WA4KJY-7::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,W4LAW-3*,KF4CFO-7*,WA4KJY-7::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,W4LAW-3*,KF4CFO-7*,WA4KJY-7*::KI4HDU-7 :TEST MESSAGE{001

EXAMPLE 2:
Now, in a fluid environment where digi's come and go and you may be mobile and unable to get a packet to W4LAW-3, you may not know the exact digi's that your message must go thru to get to me.

The creator of APRS came up with this great thing - it's the alias. Let's assume in the above example that all of the three digi's involved have "WIDE" as their alias. Your path becomes much easier:

WIDE,WIDE,WIDE

And the progression on the air looks like this:

N4UBK>APRS,WIDE,WIDE,WIDE::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,W4LAW-3*,WIDE,WIDE::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,W4LAW-3*,KF4CFO-7*,WIDE::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,W4LAW-3*,KF4CFO-7*,WA4KJY-7*::KI4HDU-7 :TEST MESSAGE{001

EXAMPLE 3:
In addition, other digi's will hear your packet as it goes along. Let's say that W4YYM has his digi up also with an ALIAS of WIDE, and hears W4LAW-3. That would generate another packet:
N4UBK>APRS,W4LAW-3*,W4YYM*,WIDE::KI4HDU-7 :TEST MESSAGE{001

And if NA4IT has his digi up also with an ALIAS of WIDE, and hears KF4CFO-7 and W4LAW-3, that would generate one more packet:

N4UBK>APRS,W4LAW-3*,KF4CFO-7*,NA4IT*::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,W4LAW-3*,W4YYM*,NA4IT*::KI4HDU-7 :TEST MESSAGE{001

EXAMPLE 4:
Now, the last example shows a potential problem. As more stations come on the air, the "extra" packet generated by NA4IT could become a problem. Thus was invented the WIDEn-N option. In a WIDEn-N environment, your path would become:

WIDE3-3

indicating that you want the message to travel 3 hops and it has 3 remaining. These packets on the air would look like this:

N4UBK>APRS,WIDE3-3::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,W4LAW-3*,WIDE3-2::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,KF4CFO-7*,WIDE3-1::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,WA4KJY-7*,WIDE3*::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,W4YYM*,WIDE3-1::KI4HDU-7 :TEST MESSAGE{001
N4UBK>APRS,NA4IT*,WIDE3*::KI4HDU-7 :TEST MESSAGE{001

We have reduced the packet count! - why? the WIDEn-N allows some computations to figure out that a packet is a duplicate, so NA4IT would be smart enough to not sent it out twice.

Having said that, WA4KJH-7 does not currently support WIDEn-N paths, so as a result, I would never see your packet. And in the real world with other packet traffic is zooming around, collisions are likely, so it would probably take multiple tries for you to get that message to me.

I should also note that the alias of RELAY was designed to be the only alias that low-level home stations would respond to. This way, if you had a low power tracker, you could use a path of RELAY,WHATEVER and have the home digi relay your packet to the bigger (thus the alias name) WIDE digi's. It was assumed that RELAY would only be used in the first position in your path to prevent a WIDE digi from hearing your packet, then haveing every home station in range digi it again (this assumes that in general, the WIDE digi transmissions cover the area of the RELAY stations). Most WIDE digi's will also respond to RELAY just incase they hear you direct. In the new WIDEn-N environment, RELAY stations are encouraged to respond to WIDE1-1.

Now, back to your question on what path to use. It really depends on what you want to accomplish. If you only want local stations (those within one digi hop) to hear you, then all you need in your path is a single hop or WIDE (with WIDEn-N digi's, this would be WIDE1-1 or WIDE2-1).

If you want to get your packet to be RELAYed by home stations, then out to the local area, a 2 hop path of RELAY,WIDE would be used (with WIDEn-N digi's, this would be WIDE1-1,WIDE2-1).

If you want to get to an IGate, then it depends on how many hops an IGate is from the digi. Most of the area is pretty well covered by IGates, so the 2 hop path above will generally work. In some areas, you may need to go to a 3 hop path, so RELAY,WIDE,WIDE (NOTE: if W4LAW-3 hears you direct, this is the same as the second example above) or WIDE1-1,WIDE2-2 in a WIDEn-N environment.

So, if I were you, I would try a path of:

WIDE

and test your results. If you find that you are not getting out as far as you would like, try:

RELAY,WIDE
or
WIDE,WIDE

One purpose of this group is to let you try things like this and have others help you know what is happening on RF - you can't hear what is happening once the packets get digi'd out of range, so you need more eyes/ears to help really understand what is going on. For example, I can tell you that I have not heard your station via RF at all today.

One more thing. The APRS at the beginning of the path is not really part of the path, but it is a destination ID which is generally not used in APRS - as with everything in APRS, there is an exception - the MIC-E format.

Let me know if this clears things up or makes them more confusing.

From: Robert Dickson
Topic: 228 Message: 235

Thank you for the correct paths.
I left it at RELAY,WIDE.
I don't hear W4LAW-3 Digi when I send.
Maybe tomorrow will inprove, condition wise.
Have a great night and 4th weekend.
Bob/N4UBK

236. UI View maps

Yahoo group: EastTNAPRS
Date: 2005-07-03 04:09:00 UTC
From: Jeff Yawn
Topic: 236 Message: 236

Hi eveyone. New to the group but not new to aprs. Does anyone have any "good" maps for UI View? I just can't see $50 bucks plus for Precision mapping or for that matter $60 to register winaprs.

Really nice to see wx4mrx back on the map...

Topic: 227 Message: 237

I had suggested to them trying UI-VIEW 32 a long time ago. DOS APRS is ooolldd! I believe a good functional APRS system there would really enhance SKYWARN.

Jeff,
Get UI-Terra. It is free and allows you to download custom maps off the Terra Server web site. Only drawback is that if you are using UI-VIEW without being connected to the internet, you either can download the maps, or you have to do the before hand. It worked well for me until I got Delorme SA. I just downloaded a bunch of maps for the area, and the UI-Terra saves them to your UI-VIEW Map directory.

There is a link to UI-Terra in the Links section of this group.

239. APRS Rig Setup Suggestion

Yahoo group: EastTNAPRS
Date: 2005-07-03 12:00:13 UTC
From: Scott
Topic: 239 Message: 239

Here are a couple of things I did at KF4CFO-7 that I believe are a good idea when setting up an APRS rig for a home station that will be unattended.

(1) We got a brand new ADI 147 2M rig. It has a really big heat sink, but no fan. We put a small 12V fan on the bottom of the sink blowing up with some wire ties, and it keeps it really cool.

(2) Ever heard someones software "hang up" in transmit mode? Pretty much kills the APRS system! So, to make sure it doesn't keep doing it, set the time out timer in the rig to one minute. It will still do APRS just fine, but if the software hangs up, at least it will unkey in one minute!

APRS+SA will do bulletins. It also has a good mapping program when you
put it all together. I'd be interested in knowing what they end up using.

From: David Hoffman
Topic: 228 Message: 241

Chattanooga has a few APRS users. I moved from Chattanooga five years ago. They seem to have the same folks that pull APRS out of the woodwork only when they are doing an event. They do not generally use APRS in any of their events, but if enough people request it, the same folks all say they have it and will use it. I've been trying to get them to look at using it more often in their events, but it never changes. I built my APRS box about 8 years ago and gave up on them when I moved 5 years ago. I hope things have changed. Doug Woodruff has done a good job getting digi coverage up on Signal Mountain. He's the W4LAW-3 digi up there. He is the guy responsable for getting me started in APRS. You have excellent coverage from there into High Point and down to WA4DSY i-gate there just above Atlanta. I would imagine that there may be quite a few more i-gates these days. Good Luck though. Welcome to Tennessee.

Oh, I meant to add a comment about repeater coverage. Check out http://members.isp01.net/ke4fgw/wj9jrg.html for a list of repeaters in the area. I know alot of the locals hang out on 146.61 & 146.79 quite often. You also have 145.39 which is up on Signal Mountain. That seems to be the usual set of repeaters that get used all the time. Review the list as there are many in town. Chattanooga has more UHF repeaters then VHF. So if you have UHF radios, there are quite a few in use there.

From: Roy E. Pollard
Topic: 204 Message: 243

Hi All;

I checked out one of the rest stops that was used last year for the MS150,
Aid Station #6 -- Coning Family Farm & Market 35d 39.97N 83d 59.92W.

APRS coverage was useable in that spot. Using the small 2M/70CM antenna
on my truck I was able to reach WA4KJH-7, WA4BDS-1 and K4RWH directly.
I was using a Kenwood TM-D700A.

This may also be a good spot for a digipeater.

Roy

How much power were you running at the time?

It would be nice to test a digi at that location to see what kind of coverage it has of the route; with the event only a few weeks away, we may only get that information during the event.

I assume that from that location, you could not hear KF4CFO-7. That would indicate to me that we need another digi (maybe multiple) between that location and Athens. The digi between that Aid Station and Athens would need to hear KF4CFO-7 and by the digi at Aid Station 6 (or WA4KJH-7). I'm thinking one along 411 - maybe as far down as Vonore, maybe further down. I assume that Net Control will be at the same place as last year, Union Grove Church. That is basically on the county line on HWY 72. It would be nice to know what part of the route that location can cover. Again, testing would be required to know if that location would be a good digi. Then we may need another down around Englewood.

You know, from looking at the map, the tower that hosts 145.310 looks like it is in a really good location for a digi. Given how well this repeater covered that end of the route for voice communications, It may be all that would be needed.

Assuming that we get digi's setup to cover the route, the one thing that needs to happen is that the Net Control station needs to be able to see all positions all the time. Given that, our mobile trackers may need to run fairly long paths; maybe RELAY,WIDE,WIDE would be enough. But without the location of the digi's in place, we can't really determine this setting.

I assume the route between Maryville and Townsend is well covered by WA4KJH-7 - can anyone confirm this?

Does anyone know the coverage of KF4CFO-7?

I was running about 40 watts from the TM-D700A.

KF4CFO-7 is on the list of stations on my TM-D700A but I dont know how to tell if the signal came direct or not. I did not have a computer with me. The route from
aid station #6 to Townsend may not be well covered because it is behind a mountain
range from the repeater.

I might add that my reception was much better with the truck engine off.

Sorry for the delayed response - this note got lost in my inbox somehow.

I'm not using Precision Mapping with UI-View32. From everything that I have heard on other lists, this is THE combination of software to use; UI-View with Precision Mapping.

Has anyone else given this a try?

On Fri, June 24, 2005 11:07 pm, WA4YYM@... said:

From: Scott
Topic: 249 Message: 249

Hey group,

Everyone plan to take a trip to Athens TN Saturday July 16th for the 1st MCARC HAMFEST. We hope to make this a yearly event, and also hope to make it larger in the years to come!

Check out http://www.qsl.net/kf4cfo/fest/fest.html for further info!

Tell your buddies, please!

250. MS 150 Route

Yahoo group: EastTNAPRS
Date: 2005-07-04 21:21:47 UTC
From: Roy E. Pollard
Topic: 57 Message: 250

07-04-2005

I checked out the part of the MS150 (2004) Route from Union Grove Baptist Church to Hwy 321.

At Union Grove Baptist Church I was unable to copy packets from WA4KJH-7 digi.
I was unable to send packets to WA4KJH-7 digi.
I was able to copy packets direct from K4RWH.
I was able to send packets direct to K4RWH and WA4BDS-1 from the Church.

Stations K4RWH, WA4BDS-1 and WA4KJH-7 was able to copy direct most of the packets
on the complete route from Union Grove Baptist Church to highway 321 near Heritage Hi School.

The equipment: Kenwood TM-D700A @ 40 watts, Garmin GPS12, 60" 6M, 2M & 70CM magmount on
top of truck.

Thanks for taking the time to run the route!

I was helping Moe get a his APRS station up and running and got to watch a large part of your travels.

It seems that you were able to hear/talk to WA4KJH-7 not far from Union Grove. I wonder if a better antenna setup (or one with some height on it) would be able to reliably get to WA4KJH-7. If so, that would be the ideal location for a digi - that would help cover the area from there on toward Vonore and would help week stations between K4RWH's location and Union Grove get into WA4KJH-7.

Has anyone ran the route from Athens up toward Union Grove?

Union Grove church has been suggested as Net Control again. And the NcMinn ARC has been asked to furnish our trailer, which we will. The trailer has a 30ft mast on it for supporting antennas. With a good all directional 2M antenna, we should be able to do OK on APRS. Voice can use the roof mounted antennas.

My only thought is that our trailer is going to take up some room (it is 7' x 16' not counting the tongue) and it needs to be set up fairly level. May be something we have to look at, and I would not want to put it there unless the church says OK. When I run the Athens end of the route for an APRS check, I'll drive up there and take a look, then get back with Charlie Wheaton and see what we need to do.

With almost 1/2 of the participants in the survey choosing to do the net, but to pick another date I think we need to determine a day to have the net.

I don't have a real opinion - except that I am often out of town Monday - Thursday. I would like a Sunday night net, but I do not know how that would fit with the church or other NET schedules.

I'll toss out Sunday night at 9:00 pm Eastern and I'll sit back to collect what you all think would be a good day/time.

Thanks to William for the invitation.

I got started in HAM Radio about 8 years ago mainly because of an APRS demo that I saw at Field Day one year. I've been fairly active in APRS ever since (or at least was until I started school at Clemson University and couldn't put up any antennas on the roof of the dormitory :-)). I spend most of my time in SC now, but still have ties to East TN and am glad to see APRS growing in the area. You may see me mobiling around the Sevier County area from time to time, but you're more likely to catch me through an IGate in the Charleston or Clemson, SC area.

Now on topic...

I noticed some recent discussion on digipaths and what paths were good to use for certain purposes. I put together a Powerpoint presentation a few years ago for the Blount Co. ARES Group that illistrates a few path considerations - mainly the benefit of using fixed paths between known, fixed stations to reduce channel load. If there are other visually-oriented people like myself out there, I'd be happy to comment and post the presentation to go along with the nice textual explanations already posted.

Again, glad to be a part of the group.

With almost 1/2 of the participants in the survey choosing to do the net, but to pick another date I think we need to determine a day to have the net.

I don't have a real opinion - except that I am often out of town Monday - Thursday. I would like a Sunday night net, but I do not know how that would fit with the church or other NET schedules.

I'll toss out Sunday night at 9:00 pm Eastern and I'll sit back to collect what you all think would be a good day/time.

Welcome to the group! I'm glad to get people in here that know a bit about APRS and can help us new ones do the right thing.

I would like to see your presentation. I've seen others try to give a visual representation of how digi's and paths work, but I have not seen anything that I can easily follow. If you don't mind, please post it to the files area of this group.

Thanks for joining the group!

Paul, I was there and saw your Power Point Demo for Blount Co. Can I get a copy of that? There is allot of discussion right now on paths. We all are trying to get some more education on this topic and do some experimenting ourselves to help us better understand paths. I realize your ppt file may be a little outdated now because of the new pathing thing, but I'd still like to take a look at it. What do you currently use for your path? Do you have any comments for us on this new WDIE N-n path thing? Thanks

265. New poll for EastTNAPRS

Yahoo group: EastTNAPRS
Date: 2005-07-06 20:43:23 UTC
From: EastTNAPRS@yahoogroups.com
Topic: 212 Message: 265

Enter your vote today! A new poll has been created for the
EastTNAPRS group:

Which APRS software do you use?

o UI-View
o APRS+SA
o Xastir
o WinAPRS
o DosAPRS
o Other

To vote, please visit the following web page:
http://groups.yahoo.com/group/EastTNAPRS/surveys?id=1246203

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

266. RE: Digipaths

Yahoo group: EastTNAPRS
Date: 2005-07-06 22:10:11 UTC
From: Paul Wightman
Topic: 260 Message: 266

I'll try to get the PowerPoint commented and posted by this weekend. It wasn't designed as a stand-alone presentation so wouldn't be very clear if posted as-is.

I don't have any specific comments on the WIDEn-n protocol. I do like the theory but haven't studied it in real-life traffic so I can't talk much about its use. I will say that anything that will reduce loopbacks (as they're called in computer networking - packets travel in loops, passing through the same switch/digi/whatever more than once) is a good thing. The probability of collisions can be greatly reduced if digipaths are used correctly.

Notice I saved your "What do you currently use for your path?" question for last. This is a loaded question. My path varies by what I want to do. When I first got started in APRS, I used "WA4KJH-7,WIDE" as my default path because I was nothing more than a normal home station and wanted to be seen by users throughout East TN - those I would be likely to interact with during ARES events, SKYWARN nets, etc. When I started running a 2m<=>30m gateway, I changed the default path to "WA4KJH-7,WIDE,WIDE" to extend my beacon further since I was the only gateway (to my knowledge, at least) within a few hundred miles and I wanted 2m APRS users to know that there was a gateway within easy reach. For my mobile station (KF4UIA-9) and HT (KF4UIA-6), I vary the path between "RELAY,WIDE" and "RELAY,WIDE,WIDE" depending on where I am and how far away the nearest IGate is (I feel it is important for me to reach an IGate because I don't know many people in my current area and findu provides an easy way for friends and family to find me should I drop off the face of the Earth).

Now, all that said, I tend to use many other paths, as well. On the home station where it is fairly easy to change the path - just a few clicks/keystrokes if you've set them up beforehand, I would specify a path using actual digipeaters and not aliases when having a QSO. In specifying the path, I eliminated the possibility of my packets colliding with themselves and reduced the chances of my packets causing hassles for other users. Hopefully the PowerPoint presentation can show this visually when I get it posted.

Try to think of your digipath like you do your RF power level. You only need so much power (so many "hops") to get your signal (packet) from your station to the target station. More power will only mean that others who don't have anything to do with your QSO will be able to hear you AND, MORE IMPORTANTLY, that you will be taking up that portion of the spectrum for a much larger geographical area than you would be with a lower power level, thus preventing others from using that same portion of the spectrum. Use a beam for your antenna instead of an omni-directional vertical (specify the digipeaters you want to use instead of using aliases) and you further limit

the scope of your signal, therefore allowing more stations to use the same bandwidth.

Sorry for such a long post, but as I'm sure you have already figured out, proper routing is a MAJOR part of maximizing the effectiveness of the APRS Network. There is no one way to route your traffic, and I'm not claiming to know the absolute best way, either. You will get as many different answers to routing questions as there are people who use APRS. I just hope I was able to justify my reasoning enough to give at least a little worthwhile guidance.

All of this sounds very reasonable and thanks for the reply. I think you are correct. For the purpose on hand, which is to have a mobile tracker traveling into several different areas at a time, I tend to stick with RELAY,WIDE. Not knowing what would happen in the Omaha area on my last trip, I went with RELAY,WIDE,WIDE which seemed to work very well. I did see that many of the balloons used WIDE3-2 or WIDE2-2 and they seemed to work very well too. I don't know what would be the correct path to use given a certain area. When I travel, I don't want to have to change my path from one thing to another throughout my trip. I want to set it and leave it kind of thing. Now I can change it for the purpose or event on hand. Like when we run our upcoming tests etc. I used RELAY,WIDE when I traveled to the Hamvention this year, and it worked very well too. So this is why I still use RELAY,WIDE as my path. I can't see changing it until it stops working. I find many areas are able to deal with both kinds of paths and many digis are changing to adapt to both kinds of paths some how. I guess what I'll need to do is start playing with both paths and see what happens. But when I travel with my APRS tracker for now, it's RELAY,WIDE for me.

272. APRS Net

Yahoo group: EastTNAPRS
Date: 2005-07-08 13:54:55 UTC
From: William McKeehan
Topic: 272 Message: 272

The general consensus appears to be for a Sunday night net @ 8:00 pm Eastern time.

I will try to contact the repeater owner to make sure he is OK with us having a net on his machine - I do not anticipate any problems, but still want to get his permission.

For this first net, I would like to do a few things.

1. Take check-ins via phone
Callsign, Name, APRS Hardware/APRS Software

2. Brief explaination on how to send messages with the various APRS programs, using a specific path.

3. Repeat the check-ins via APRS messages - using voice as necessary. Have everyone try a path of WA4KJH-7 to see if they can get a check-in to my station and identify those that do not get to me and further identify what path they need to get to me.

4. Open discussion.

5. Identify a time/frequency/net control for a future net. (Do we want this to be a weekly, bi-weekly, monthly, or one-time-only net?)

I am open to other ideas for the net.

273. McMinn-Monroe end of MS Bike Ride

Yahoo group: EastTNAPRS
Date: 2005-07-08 19:53:56 UTC
From: Scott
Topic: 273 Message: 273

Well, this AM I rode the route from Englewood to Union Grove BC off Hwy72. (I got lost a little, forgot the route directions...duh!) I don't believe we will have any problems from Englewood to Mayfield's in Athens, as I could hear KF4CFO-7 S-9 +20 in Englewood.

The thing I see we are going to have to do is "self-digi" and everyone be on the same page to get this thing done. Here is what I suggest according to my findings:

(1) Run a 50W digi station out of our MCARC MCT with the antenna @ 30ft. Digi path responding to RELAY, WIDE, and WIDEn-n.
(2) ALL mobiles run as digis responding to RELAY
(3) ALL mobiles run APRS,RELAY,WIDE,WIDE in their beacon.
(4) As slow as the bike ride moves, I believe a beacon interval of no more that 5 minutes should be sufficient.
(5) HT's as transmitters WILL NOT get the job done...it will probably take at least 25W mobiles. (I was running 50W all day.)
(6) A good 5/8 wave antenna on top of the vehicle will be best.
(7) Of course everyone will need a voice rig.

The main objective is for NET CONTROL to be able to "see" everyone on screen. Individual mobiles probably WILL NOT be able to see everyone, as I could "hear" bursts, but they were not strong enough or stable enough to decode.

The only other "fly in the ointment" I can see is that the church may not want our trailer taking up space in the parking lot. And I couldn't blame them. I was totally surprised that they allowed their lot to be used as a rest stop with their morning services going on. We need to really address this issue with them, and I have already been in contact with Charlie Wheaton about it. We may have to look at some private land owners lot or something.

Here is what I will do...I will furnish the radio (50W), TNC, and computer (desktop) for the APRS station in the MCT. (If someone has a decent laptop, that would be great! mine is a Win3.1 w/ 4MB or memory...SLOW!) The only antenna I have that I can put on top of the mast will be a 5/8 wave mobile antenna, if everyone thinks this will work. That will leave the two dualband rigs in the MCT available for voice, one on 145.310 and one on 146.940.

I will bring someone with me from our club to help out with the trailer. We have one member who grew up in Monroe Co and knows ALL the route we took last year like the back of his hand. If I can get him, that will cover an NCS rep for McMiin and Monroe. We need someone with Blount Co that knows the route in there also.

Thoughts, rants, raves? your turn...

If you play back a UI-View32 log file you will see all the stations you
were able to copy
from the TNC.

The trick is to set the Exclude/Include list under setup to include only
the station you are tracking.
Place "!NA4IT-9" in the left side and it will only look at
NA4IT-9. Notice the !
Also place NA4IT-9 in the auto track list that is located under setup.

You can then play back the file and only display NA4IT-9.

From: Scott
Topic: 274 Message: 278

The only way I know to do it is to record a log file, then play it back and track the station. Seems like I did that with KC4OJS in the airplane and it worked.

I have found out how to play the log file and track a station in UI-View32,
but I use APERS+SA
when I want to see the trail. That along with the dynamic map is APRS+SA
strong points.
That is why I run both programs at the same time. I have not found out how
to log
and replay in APRS+SA. If you learn how to do that let me know.

Dumb question, the percision mapping that you are talking about, is this
free or something I have to purchase... or can I get a copy from someone....

I should be up on the air this morning thanks to William....

Moe N4CQW

This must be purchased from Undertow at _http://chicagomap.com/_
(http://chicagomap.com/) for $49.99. Once the program is registered, then download and
install the PMAP 7 server (free, but must be registered also). This program
is entirely seamless with UIView and the best thing I have found with UIView.
I also have tried Street Atlas v.7.0 which works fine, but it does not work
as slick as Precision Mapping and the map transitions are all done manually.
PM does all this automatically and this is critical when mobile or tracking.
I can't say enough about this program. I have version 5 which I bought at
Dayton a couple of years ago to run with WinAPRS which also supports this
program, although I mainly used Tiger Maps for it. I will not be going back to
WinAPRS except as a backup.

Guys, here is one of those once in a lifetime APRS contacts! I had
been sending out a bulletin all day about our upcoming hamfest. Read
the lines just after the bulletin:

NA4IT ³MCARC HAMFEST ATHENS TN JULY 16TH www.qsl.net/kf4cfo
WS5R-1 ³<A007>Gues I'll miss it as I am in Iraq!
NA4IT ³<A25>Good to hear from Iraq! We are praying for you guys!
NA4IT ³<A26>Good to hear from Iraq! We are praying for you guys!
WS5R-1 ³<A013>Thanks, name here is Ben from Amarillo, TX.
NA4IT ³<A27>If you see anyone from 278th Athens TN tell them Hi!
Scott here.

GOD BLESS OUR TROUPS!

Awesome! My son, Sgt.Chris Robinson was in Iraq with USMC Mike Battery out
of Chattanooga. He returned in March. They were the artillery battery
during the assault on Fallujah and did convoy security and ground operations there
also. Chris was a section chief in communications, although he has yet to
get his ham ticket. He is currently in San Diego training to be a recruiter in
Cleveland. He is a proud graduate (as are his parents and a sister and a
brother) of UTK in Forestry and Wildland management.

Well...

Each digi owner has the ability to set their digi up to respond to whatever they want to. The nationwide coordination that had all home digi's supporting an alias of RELAY and all big digi's supporting aliases of WIDE and RELAY made it possible for travelers across the US to use a single path and be heard and digi'd as they travel.

There were some issues with these aliases - I was not around back then, so I don't really understand, but some new aliases were introduced: WIDEn-N. This let you easily specify the number of wide hops while reducing the length of the packet. For example,

RELAY,WIDE5-5

is equivalant to:

RELAY,WIDE,WIDE,WIDE,WIDE,WIDE

Once that got going, they ran into another problem - especially in big cities - frequency overload. If you look at the stations that we can see on RF, you see that just a few hops will bring in stations for hundreds of miles. Some of the big cities could not handle the extra traffic from outside. AND RELAY and WIDE allow duplicate packets (one digi sending the same packet multiple times) which just made the problem worse.

So a recent effort has been to eliminate both RELAY and WIDE - some digi's are doing this, others are not. It has been done in Memphis - running a path of RELAY,WIDE there gets your packets now where. In most parts of the country, digi's support both the old (RELAY,WIDE) and the new (WIDEn-N) aliases (this is true down near Chattanooga and over toward Nashville), so either setting will work. Around here, some of our digi's do not support the WIDEn-N alias, so you would need to stay with the old aliases for a while.

William, when you travel to Memphis, do you make a settings change in regards to path? If you do, then you have to make that change every time you go to Memphis. Plus you have to remember to make that change when you come back home. Do you go through this trouble each time or have you found a path setting that works in both places? Have you found a setting that you can use in both places without changing it depending on where you are? What do you use?

When I run a tracker in Memphis, yes, I have to change the path setting. They do not support either RELAY or WIDE out there at all, so when I go there, I change the path to WIDE2-2 and that generally gets me into an IGate.

Then I do have to remember to set it back to WIDE or RELAY,WIDE when I get back home.

Most places now support the new WIDEn-N thing and a few places are like Memphis and have dropped support for RELAY and WIDE.

Subject: [EastTNAPRS] McMinn-Monroe end of MS Bike Ride

Well, this AM I rode the route from Englewood to Union Grove BC off Hwy72. (I got lost a little, forgot the route directions...duh!) I don't believe we will have any problems from Englewood to Mayfield's in Athens, as I could hear KF4CFO-7 S-9 +20 in Englewood.

The thing I see we are going to have to do is "self-digi" and everyone be on the same page to get this thing done. Here is what I suggest according to my findings:

(1) Run a 50W digi station out of our MCARC MCT with the antenna @ 30ft. Digi path responding to RELAY, WIDE, and WIDEn-n.
(2) ALL mobiles run as digis responding to RELAY
(3) ALL mobiles run APRS,RELAY,WIDE,WIDE in their beacon.
(4) As slow as the bike ride moves, I believe a beacon interval of no more that 5 minutes should be sufficient.
(5) HT's as transmitters WILL NOT get the job done...it will probably take at least 25W mobiles. (I was running 50W all day.)
(6) A good 5/8 wave antenna on top of the vehicle will be best.
(7) Of course everyone will need a voice rig.

The main objective is for NET CONTROL to be able to "see" everyone on screen. Individual mobiles probably WILL NOT be able to see everyone, as I could "hear" bursts, but they were not strong enough or stable enough to decode.

The only other "fly in the ointment" I can see is that the church may not want our trailer taking up space in the parking lot. And I couldn't blame them. I was totally surprised that they allowed their lot to be used as a rest stop with their morning services going on. We need to really address this issue with them, and I have already been in contact

with Charlie Wheaton about it. We may have to look at some private land owners lot or something.

Here is what I will do...I will furnish the radio (50W), TNC, and computer (desktop) for the APRS station in the MCT. (If someone has a decent laptop, that would be great! mine is a Win3.1 w/ 4MB or memory...SLOW!) The only antenna I have that I can put on top of the mast will be a 5/8 wave mobile antenna, if everyone thinks this will work. That will leave the two dualband rigs in the MCT available for voice, one on 145.310 and one on 146.940.

I will bring someone with me from our club to help out with the trailer. We have one member who grew up in Monroe Co and knows ALL the route we took last year like the back of his hand. If I can get him, that will cover an NCS rep for McMiin and Monroe. We need someone with Blount Co that knows the route in there also.

Thoughts, rants, raves? your turn...

Thanks Travis, but UI-VIEW32 is windows only. I'll probably just use
one of my extra desktops, that way it will be plug and play. Don't
want to do a lot of configuration when we get there.

I was doing some testing earlier in the week with a little add-in to Xastir that I wrote. These objects were "waypoints" along the MS-150 route. I have an automated method to generate the objects and was testing that to see if it worked and how well the objects were transmitted.

I was talking with someone about APRS at events this weekend and they were telling me some lessons learned with some events in St. Louis.

Everything we are doing sounds great, but there is one additional recommendation. The Net Control APRS station should be listen only. The logic is that everyone knows where net control is (this can be established well ahead of time) and getting position reports into NC is the primary objective, so the more time NC spends listening, the better.

Sounds like a great idea to me. What do you think?

I can see that, but I don't know if it can be done and still be a digi... I think if we set the beacon on NCS for say 30 or even 60 minutes, it shouldn't be a problem.

There should be no need for an object, as the APRS Net Control station will be in the MCT. And, I know having the waypoints cast on the map as objects would be nice, but remember, the more that is on the map, the more clutter there is. Basicly, all we need to see are stations that are on the route so that we can track progress or send help to a station location on the map.

294. Our First NET!

Yahoo group: EastTNAPRS
Date: 2005-07-11 02:42:26 UTC
From: William McKeehan
Topic: 294 Message: 294

Well, I think our first net was a success.

We had 15 voice checkins and 6 APRS checkins.

Roy, WA4BDS, gave a brief discussion on how to send messages using UI-View32. Scott, NA4IT, added some details about selecting the appropriate port for sending messages via an Internet connection.

No one came forward with instructions on how to send messages with APRS+SA.

I gave a brief overview of sending a message with Xastir.

I also rambled on about a few other things - mostly about joining this group :-)

Rod, K4RWH, indicated that he may be setting up an APRS weather station soon and would have details as he makes progress.

Overall, I thin the net went well.

Now, we have to decide if the net is enough value to continue.

At this point, I would like to continue the nets for a while - rotating the Net Control function to any that may be interested.

Let me know what you guys think.

But he does not need to be a digi - if he get's the packet, that's all that we need to accomplish.

The only reason it would beed to be a digi would be to support messages between stations participating in the event.

296. New to this phase

Yahoo group: EastTNAPRS
Date: 2005-07-11 02:49:32 UTC
From: David
Topic: 296 Message: 296

I am trying to understand and use this function of ham radio. I know what gps are, but for this use, I dont have a clue. I have an unregistered version of APL+Win ver 4.0.03, and still trying to figure the bells and whistles to it. I can only use this from the computer at the moment, but want to upgrade as the money becomes available. Since this is unregistered, I have to rekey all my info everytime I log onto it. I would like to know where I could find the (so-called) short cut commands or keys, if any. Thanks in advance for any and all assistance.

From: Scott
Topic: 273 Message: 297

I guess we could jusy leave the beacon set to "0" minutes. However, we might need to be able to do an "?APRSP" to find someone by setting their beacon off. Then I guess we could do a "F9" which is the manual beacon in UI-VIEW32.

298. Re: New to this phase

Yahoo group: EastTNAPRS
Date: 2005-07-11 04:21:59 UTC
From: Scott
Topic: 296 Message: 298

Hey David,

I think you may be a little confused (as most of us are!). This group is about APRS, the Automatic Position Reporting System. This is a mode of amateur radio that uses packet communication to produce an icon on a map to show where a particular station is located. It can be very useful for search & rescue, as well as tracking, which is what it is designed for.

It can also be used for weather spotting and Skywarn, and the NWS uses it profusely in projecting weather warnings, watches, etc on the APRS map.

Go take a look at www.findu.com/cgi-bin/find.cgi?NA4IT to learn more. What you will be looking at is my station location projected on a map. This can also be done between 2 radios. Along with the position projection, we can also send one line messages.

APRS operations take place on 144.390. Tune there and you will hear the packet bursts. It is 100% digital operation.

Hope that helps a little.

Scott NA4IT

299. Hmmm. Monroe Co digi

Yahoo group: EastTNAPRS
Date: 2005-07-11 04:26:50 UTC
From: Scott
Topic: 299 Message: 299

Well, Charles brought a HUGE box of stuff to see what we can do with
to make one,two or however many APRS stations we can.

(1) I thought the digi was going to go in Madisonville. It actually is
going in Sweetwater.

(2) He has the following TNC's, of which he would like to make a
standalone digi out of one:
(a) Kantronics KPC 9612
(b) MFJ 1270
(c) PacComm Tiny-2 MK-2

Also has a Kenwood TM-D700A

Suggestions???

If you are participating in the event, you know it's there because of the plan ahead of time. If you happen to send messages, yes, ack's should be transmitted.

> but I know from using the same software William does if a station doesn't
> appear it dims out and once it's gone you can not find it

This is an option check
Station - Filter Data - Include Expired Data
or
File - Configure - Timing

> or TX to it on a
> map, is this not correct William?

What do you mean TX to it? You can send a message to him with Xastir (and I would think most other software packages): Message - Send Message and manually enter the callsign.

>
> I know I have played with placing an object on the map is tha what you want
> to do? You said everyone see it, but what is it's active life if it's not
> set up to beacon?

How objects are treated depends on the software that you are running. Xastir will use the decaying algorthim to transmit an Object's position - much like sending a message.

302. Sweetwater Digi

Yahoo group: EastTNAPRS
Date: 2005-07-11 19:41:52 UTC
From: Scott
Topic: 302 Message: 302

Well, guys, let me explain what Charles stuff can do, and give me some feedback.

I can put together his Alinco DR1200T Data radio with his Kantronics KPC9612 TNC as a standalone digi, i.e. no computer. The radio is listed to have 25W output.

Here's what it will do:
It will be set to beacon every 30 minutes with the stream "!3536.61NS08428.93W#..SWEETWATER DIGI WIDE ONLY".
It will be set to ID every 9.5 minutes when in use.
It will have the callsign K4EZK-9.
It will digi on "K4EZK-9" or "WIDE".

The TNC is limited in what you can set as the alias, as it takes one "word" or call and that is it, hence the "WIDE".

It will be located just to the east of I-75 at Exit 62, Oakland Road at a building used for the EMCOMM work of amateur radio in Monroe Co.

What do you think...worth it or not?

Also got Charlie's Kenwood TM-D700A up and going, both as standalone APRS unit and with a laptop running UI-VIEW. SWEET running system, just tooooo much funds for me! He is going to use it personally, has a GPS and all the cables to go with it, and use it for EMCOMM when the Monroe EMA Trailer is deployed.

If it can only use one alias, I would recommend it use RELAY instead of WIDE -
unless it has a particularly wide coverage.

If it can hear low powered stations and RELAY them to KF4CFO-7, then it may be
well worth it. I would set it up and put it in that location to see.

>

I agree - the D700 is a nice radio for APRS, but they are not cheap.

One more thought...can the firmware or prom or whatever is in this TNC be upgraded to support more options? like more aliases or even the new WIDEn-N stuff?

I made an announcement (late) during the RACK net this evening
announcing the EastTNAPRS net on Sunday Nights at 8.

I would encourage you all to make similar announcements on nets that
you regularly participate in.

Thanks!

I am checking into the firmware. It would make it the same as the KPC-3, except the 9612 has a 9600 baud port also (might make for a good "crossband" digipeater!). It will be a few days before it goes up (Charlie is on vacation) and I'll probably hear back from Kantronics tomorrow.

I also changed KF4CFO-7's beacon to APRS,RELAY,WIDE,WIDE instead of APRS,RELAY,WIDE2-2 tonight. Let me know how you think it does. Seems to be OK to me.

307. MCARC Athens Hamfest

Yahoo group: EastTNAPRS
Date: 2005-07-12 02:41:46 UTC
From: Scott
Topic: 307 Message: 307

As far as we know now, the hamfest for Saturday (July 16th) IS on. Weather forecast discusions say that we will be back into a summertime pattern of afternoon showers Saturday. The hamfest runs from 7:00AM - 12 Noon, so we should be OK. (Hey, Saturday's bath time anyway, hihi!)

We will make a definite decision Friday at 6:00AM, and make announcements on the 3980 TN Phone Nets and local repeaters. If anyone wants to check, try the 145.310 (-) 141.3 and we'll let you know!

Hope to see everyone there!

73, Scott NA4IT

KF4CFO-7 generally reaches WA4KJH-7 direct, and WA4KJH-7 responds to RELAY, so I am still seeing the packets. Other than that, I'm not sure how far out the packet is going. Does the W4LAW-3 digi support WIDEn-N?

About the only way to know how far it's packets are traveling would be to ask some stations that you see on APRS a couple of hops away to see if they are seeing it on RF.

If it makes it to my station (which it is currently doing), then it will get IGated.

W4LAW-3 shows to be a RELAY, TRACE, WIDE, TN digi. Not for sure if it
does n-n or not.

From: David Hoffman
Topic: 311 Message: 311

I uploaded this pdf on APRS+SA hints for those interested. It does not tell you how to send messages, but it is a nice document on how to set up APRS+SA for tracking things like balloons etc. It gives you lots of clues on some of the features within APRS+SA that may not be so obvious without it. Hope it helps those who are trying to configure APRS+SA.

312. MFJ 1270b problem

Yahoo group: EastTNAPRS
Date: 2005-07-12 21:04:03 UTC
From: Jeff Yawn
Topic: 312 Message: 312

Ok boys and girls time to earn your keep. I have a slight problem with a 1270b I bought at the RACK hamfest. I thought it was not doing anything until I hooked it up to a radio. PWR, PTT, and STA light come on and PTT goes off after about 30 seconds. Figured out the time out timer was the cause of the ptt to drop out. I have hooked it up and low and behold when the tnc is turned on it is transmitting a tone until the TOT kicks it off. If I disable the TOT it stays trx'ing until I turn it off. I am not able to get a CMD prompt and typing "Q" to quit cal mode does not work. "K" does not stop the tone and the space bar does not change the tone. IF I change the VHF-HF switch, the tone does change. I have gone through the manual checking voltages and logic with no luck. Any ideas???

David, the factory reset is to pull the power and the battery for 15 minutes in order to dump all of the memory. It's either a bad CPU or EPROM, or one of the other control chips running in a loop. The easiest way to check this problem is to swap out the EPROM. If you have one, and I don't know if I have any old chips laying around. But if the EPROM doesn't fix it, consider the TNC to be BER.... Beyond Economic Repair.... Depending on the age of the circuit board, some of the components are no longer available.....

I have done the reset and checked cables, componentes, jumpers over and over. Not my first go around with all that. I think you may be correct all though I did not really want to believe it to be true.

Anyone have a spare eprom I could borrow just to try it? Or know where I could buy one cheap?

Moe, needless to say, I was sticker shocked as well. I decided to just build one. Mine is a very simplistic model. It is made of some plywood, some felt and some conduit pipe. I bent the conduit pipe as needed and used one of those outside flood light cover plates for a mount on the bottom side of the wood. You know the ones with three holes in them. I started out with a 1/2" galvanized flange mounted to the car but gave it up for an old cell phone rotatable mount kit that I had found. The conduit pipe needed a little modification to get one end to fit down inside the cell phone mount, but it works pretty nicely now.

My wife likes it so much that she insists leaving it in the car to hold her papers.

Oh, this brings me to another topic. This laptop mount is now in the way of the passenger side air bag. I would not recommend anything here to anyone, but I had to do something. So I disabled the air bag on just that side of the car. We always use our seat belts anyway and the laptop setup won over doing nothing.

The GPS that I want is the Garmin GPS276C:

http://www.garmin.com/products/gpsmap276c/

It has a larger display than the Garmin GPS V, uses a rechargeable lithium battery pack, has 2 NMEA serial ports, has a USB port for uploading maps.

Really, a very nice unit as far as I can tell; the only down-side (for me) is the cost of the thing - $750 MSRP.

I currently use a Garmin GPS II+ - an older GPS unit that does not support maps.

If you are planning to use the GPS with a laptop, then you don't really need to worry about the GPS's display. I would look at the Garmin GPS18; it can be found for about $90, but has no display.

I think the lowest cost Garmin with a display (not color) is the Garmin eTrex Venture. It does not have mapping, however. It has an MSRP of $150 and supports the NMEA standard.

The lowest cost Garmin with mapping support is the eTrex Legend. It has an MSRP of $180.

The GPS V's MSRP is $320 - it has a few more options, one to note is the removable antenna.

All-in-all, there are a lot of options out there and Garmin is only one brand; it's just the brand that I am most familar with.

When checking, make sure the GPS has a "pc" connection that is serial (i.e., not USB) and that it supports NMEA - other than those two things, it's up to personal preference and pocketbook.

The Garmin eTrex Legend does not support NMEA-0183 ASCII data output. In the APRS world, this is a must. You can buy a translator that converts the Rockwell Binary format to NMEA-0183, but that's another $37.

From what I'm seeing on the Garmin web site, the eTrex Legend does support NMEA.

Where are you getting the information that it does not?

There are several eTrex models, and many of them do not output NMEA, but the specification on the web site indicate that the eTrex Legend support RS232 with NMEA 0183, RTCM 104 DGPS data format and proprietary Garmin.

http://www.garmin.com/products/etrexLegend/spec.html

Well I did a comparison back about Christmas time when I got the OK to go shopping for a GPS and it did not. Oh wait, it's the Color legend that does not support NMEA-0183. That's right. And for what they wanted for an eTrex Legend B&W, I could get in color from Magellan that does have NMEA.

You are correct, the eTrex Legend C (color) does not support NMEA - seems strange, you would expect the Legend C to be the same as the Legend, but with a color display - not so.

If you did some shopping with Magellan's, can you tell us a bit about their products?

I know very little about the Magellan GPS units.

I went with Magellan because of price and being a previous owner. I had the GPS-3000XL & GPS-4000XL GPSs. I sold the 3000 and the 4000 died on me after many years of good service. However, that did not deter me from buying Magellan again. I think the Garmins are a bit pricey. I've also seen others use their Garmins and they all seemed to have some difficulty moving about the menus. I was used to Magellan's menus. I know that I ended up with a GPS that is no longer being made, but for the price, I am very pleased with it. I got a brand new, still in the original wrapper, SportTrak Color off of eBay for $209. I figured it was an upgrade from the previous GPSs that I've had, and it's color. This is the first GPS with mapping capabilities that I've owned. I'm really enjoying it so far.

I can agree with you no the navigation with different GPS units - Garmin's interface is different than Magellan's. I had an old Magellan a long time ago for a short while, but then moved to the Garmin GPS II+.

But for the price, it sounds like you got a great deal on that Magellan SportTrak Color.

One other factor to consider that I don't think has been mentioned yet is the ability to use a remote antenna. Depending on your vehicle and configuration preferences, you may not want the GPS on the dash (I know I didn't like it on my dashboard). The Garmin GPS V with its BNC-style antenna does support external antennas while many other GPS models with built-in antennas (like the eTrex) don't. Admittedly the antenna is another $80-90, but it may be worth it to you to get the GPS off the dash. On the other hand, it may not be an issue if you want to use the mapping heavily since the GPS would be much easier to read on the dash. All personal preference, but something to consider.

On a side note to all, I did get the PowerPoint presentation posted over the weekend. It's a little rough, but you'll at least (hopefully) get the idea.

Does anyone know if the GPS units that have been discussed here support
turn-by-turn driving directions?

I'm not sure about the Garmin's.

Moe, I've not really had any problems using my GPS by laying it in the passanger seat. It's true, an external antenna will be far better then any antennas inside the vehicle. But the GPS is still quite usable inside the vehicle. There are two types of built-in antenna that come on GPSs. I can't remember the technical names at the moment, but one antenna works best if held flat. The othert antenna works best if held pointing up. I think the "patch" antenna is the one that works best by holding it flat where it sees the sky perpendicular to itself. The other antenna looks like a rectangular cone something like an LNB. I guess what I?m saying here is that you will probably be just fine even if your not using the external antenna.

I've heard from other Yahoo Groups that the new MapSend DirectRoute software from Magellan does this.

http://www.magellangps.com/en/products/product.asp?PRODID=950

MapSend DirectRoute North America Available on CD-ROM
Add detailed street maps, automated street routing, and turn-by-turn directions to your Magellan? GPS handheld receiver! Magellan MapSend? DirectRouteTM is a major advance in mapping software, guiding you to your destination with turn-by turn visual guidance and audio prompts. MapSend DirectRoute works on a wide variety of Magellan GPS handheld receivers that our customers currently enjoy for outdoor recreational adventures.

335. MCARC Hamfest is ON!

Yahoo group: EastTNAPRS
Date: 2005-07-15 11:42:11 UTC
From: Scott
Topic: 335 Message: 335

The MCARC Hamfest for July 16th is ON! There is a possibility of showers in the afternoon, but hopefully we will be OK. If you come to tailgate, bring a tarp, and if you come to look, an umbrella might be a good thing!

Paul, I finally got around to looking at the presentation. I think it's a great example of how path's work; thanks for posting it.

One thing you note is that there are no 30 meter GATES in EastTN - to my knowledge, this is true. There are a few IGates which can route messages via the internet to distant stations. I use it frequently when I'm in Memphis to send messages to folks here in EastTN.

Another thing to note is that N4QEA-2 and KC4YDQ-7 are no longer operational. I would like to see both of these operational again; it looks like their locations would fill some holes.

I didn't realize YDQ-7 and QEA-2 were QRT. I haven't booted up a map while in east TN in some time - have just been running the D700. Both were good wide-area digis. Along with JKH-7, they could cover most of central-east TN as far as home stations were concerned.

Good to hear a few IGates have popped up. I don't believe there was a consistent IGate when I made the presentation or even when I left for school.

N4QEA-2's demise was a recent event - I think a group is working toward putting up a new digi to fill the hole left by it's absence.

I don't think I ever knew about KC4YDQ-7.

How new is the IGate? I get the impression that it's relatively new, but really have no idea how long it's been around. It's so easy now for a home station to become an IGate and a lot of people have a full-time high-speed internet connection that a lot of them are available. I run a bi-directional IGate, KI4HDU-2.

I moved to Clemson, SC, in August 2003, and I don't believe there was a full-time IGate at that time. I seem to recall someone wanting to set one up around that time, but I don't think it was up before I left. Sorry I can't be any more specific than that.

The first thing to check would be whether the computer is actually communicating with the D7 or not. Try opening up a terminal window and see if you get a command prompt. If you don't, make sure the D7 is in packet mode (you should see "PACKET" next to the TNC indicator). It will not communicate with the computer when it is in stand-alone APRS mode. Otherwise, there is probably some setting that is misconfigured (baud rate, etc) and someone more versed with APRS+SA would have to help you with that.

Good luck,

Paul, KF4UIA

Is the TNC in your D700 in APRS mode or PKT mode? To use it with a program like APRS+SA, it will need to be in PKT (or Packet) mode.

To go from APRS mode to PKT mode, press and hold the F button, then press the TNC button.

Sorry about that, I just assumed that you were using a D700...I should pay more attention :-)

The TH-D7 has a similar setting - press the TNC button once turns the TNC on in APRS mode (I believe), pressing the TNC button again will put it in packet mode.

348. Sunday Night Net

Yahoo group: EastTNAPRS
Date: 2005-07-18 01:11:25 UTC
From: William McKeehan
Topic: 348 Message: 348

We had a total of 9 stations participate in tonight's net; 6 via APRS.

We did a demonstration of the coverage that a single hop (WA4KJH-7) path has in the area; KF4UVT sent a message to KI4HDU-7 - it was seen by KI4HDU-7, N4CQW and KF4YMC via WA4KJH-7. So a single hop path gives great coverage in the area - I typically run with a path of WIDE (an alias for WA4KJH-7) and have this coverage, only expanding when I need messages to go out further.

I'm looking for someone to take Net Control for next Sunday - you can run both the APRS side and the voice side or you can split it between yourself an another station. I'm also interested in some topics for the net - K4RWH, maybe you could plan on talking about your Weather Station progress on the next net?

Anyone interested in being Net Control, please drop me a note.

Hey gang,
I will be leaving Monday morning for the National Scout Jamboree at Ft. AP Hill, VA. Other than my medical bag (I will be chief physician for subcamp 19, about 2,000 souls) I will be taking my D-700 and a push-up mast so I can run APRS from the Jamboree. Will be on the air hopefully on Tuesday afternoon. Look for me as WA4YYM-1 near Fredricksburg, VA. I will be one of 40,000 Boy Scouts, adult leaders and staff. My home station and IGate will be off the air until I return on August 4th. I will be running as WA4YYM-9 mobile on the way to the Jamboree on Monday and Tuesday (July18-19). I will also be running APRS on foot on the Jamboree grounds from time to time. Should be fun. It will be my fourth time on staff.

Go to http://www.apritch.myby.co.uk/uiv32.htm and register UI-VIEW32 (not Winpack). Once they email your registration to you, there will be 2 numbers on it, one is the registration number and one is the APRS server validation number. Put it in the box for it in APRS Server Setup, check the appropriate boxes, and hook up! Might want to look in the help file as to how to download a new server list so you will have a fresh list. Remember, in any window or "wizard" in UI-VIEW, hitting "F1" will popup the help file for that window.

354. Logging Software ?

Yahoo group: EastTNAPRS
Date: 2005-07-19 20:57:46 UTC
From: William McKeehan
Topic: 354 Message: 354

I'm looking for some logging software.

I'm not interested in contests, so anything specific to that is irrelevant to what I want.

I'm not interested in QSL cards (I only talk on 2 meter and 70cm).

What I want is something that will let me enter a call sign - have it pull up the previous contacts that I have had with this particular person as well as pulling their name/address info from QRZ (or from local files). I would like to have a few custom fields that I can use for whatever I choose and one "memo" field where I can enter comments.

Now, I'm looking for something free - preferably with the source code so I can modify it to my needs - ideally, written in Visual Basic.

I'm currently evaluating ACLog and while it's not ideal, it's the best I've seen thus far.

Anyone have any recomendations?

356. [Fwd: RE: [TinyTrak] Search and Rescue]

Yahoo group: EastTNAPRS
Date: 2005-07-19 22:10:13 UTC
From: William McKeehan
Topic: 356 Message: 356

I thought this was a very informative posting about the Pocket Tracker (a TinyTrak3 with a 250 mw transmitter) and how it has been used for Search and Rescue teams.

---------- Original Message ----------
Subject: RE: [TinyTrak] Search and Rescue
From: "Tony Barrett" <tonybarrett@...>
Date: Tue, July 19, 2005 5:36 pm
To: TinyTrak@yahoogroups.com

Hello Derick,

The Pocket Tracker was conceived while I was out on a multi-day mountainous winter search in March of 2003. Development started the day the search ended and we sold our first commercial Pocket Trackers exactly a year later.

Did you happen to see the picture of the weatherproof Pocket Tracker on the Pocket Tracker web page? Scroll down near the bottom of the page to see it. A blue one is shown. It's also available in black, red, clear, and safety yellow. The weatherproof Pocket Tracker was developed specifically at the request of Search And Rescue teams. I've sold many weatherproof Pocket Trackers to SAR teams all over the world.

Pocket Trackers are simple (turn it on and forget it) and lightweight (3 to 11 ounces). The batteries last hundreds of hours at a once per minute beacon rate, so we just turn them on at the beginning of the search and leave them running until the search is over. The person carrying the Pocket Tracker does not need to be the least bit concerned with it. About the only instruction needed is to keep the antenna vertical and as high as possible. It works best if the attached GPS receiver is left on or turned on frequently.

We use the time-slotting feature so none of the Pocket Trackers on the search transmit at the same time. They are all precisely synchronized to GPS time and each Pocket Tracker has its own time slot. There is plenty of time between transmissions for digi-peating.

I used a Pocket Tracker on a search training exercise once in forested mountainous terrain and the nearest digi-peater was 23 air-miles away. The rubber-duck in my vest pocket hit the network all day long.

In May of 2004 I was helping support a search in forested mountainous terrain. The nearest digi-peater was 18 air-miles away. Signals from all the Pocket Trackers reached the network on a regular basis. Later in the search we deployed a portable digi-peater in the center of the search area and from that point on we received nearly every transmission in base camp. Why is base camp

nearly always set up down in a "radio hole"?

Two weeks ago I was at a three-day SAR recertification event. It was all held in a mountainous forest-covered area. We deployed a portable digi-peater on a hilltop in the middle of the search area, but we didn't need it. Nearly every Pocket Tracker signal was received twice in base camp; once directly, and once from our digi-peater. I was surprised at how little the terrain and tree-cover affected the signal. A Pocket Tracker was deployed nearly a mile away, over a hill, and through thick forest. We still picked it up directly without the use of the
digi-peater. I'm guessing that the signal may have been bouncing off some rock face in the area.

Mountains block signals, which can be a good thing. They basically block out all other signals so the noise floor can be very low, which helps you receive "local" signals, even relatively low-powered local signals. Mountains also offer opportunities for placing receivers and digi-peaters in optimal locations. There are almost always two sides to every mountain valley. You can search on one side of the valley while you have a receiver or digi-peater on the other side of the valley.

I have copies of a series of articles that were published in QST in the Fall of 2003 about SAR and APRS. These are in pdf form and I have permission from the publisher to distribute these to SAR groups. Let me know if you are interested and I will send you copies of the articles.

I met with the author of the articles (Jeff Lehman, KD6DHB) at the International Technical Rescue Symposium in Salt Lake City. We discussed all the strengths and weaknesses of all the various APRS solutions he'd tested and I showed him the Pocket Tracker. He agreed that the Pocket Tracker addressed nearly every one of the shortcomings he'd identified with previous solutions. After our discussion I was able to make some minor design modifications to make the Pocket Tracker an even better SAR solution. Jeff has since become a Pocket Tracker customer.

We keep inventing new ways to use the Pocket Trackers. Recently we used the "Send NMEA" feature during some search dog training in an isolated river canyon. We handed a tracker to a volunteer first thing in the morning and asked the volunteer to take a walk through the wilderness. We recorded the track back in base camp, some distance away. Later in the day, after the scent trail had aged for several hours, we put a Pocket Tracker on a search dog-handler and sent the dog and handler off towards the general search area. We could see the red track from that morning on our computer screen, and we could see the new green track develop as the dog and handler moved about. Eventually the tracks crossed, and sure enough, the dog picked up the scent trail and followed it. There was no question that this dog had picked up the proper scent and was following the trail made by the mock subject several hours before. Previously, before using the Pocket Trackers, we had to flag the trail with visual markers, and then we had to send someone back later to retrieve the flags. There was always some question about whether the dog and / or handler were following the flags or following the scent. With Pocket

Trackers we don't need to flag the trail and there's nothing to pick up later. We know for certain that the dog is following the scent trail. We are usually in radio contact with the dog-handler. The training coordinator can watch the exercise on the PC screen back at base camp and can coach the dog-handler by radio as needed. This is a much more effective method of training and a great way to evaluate a dog and handler team's performance. We were surprised at how well the Pocket Tracker signal seemed to bounce along the
vertical rock canyon walls and still reach base camp over hills and around corners.

Pocket Trackers support two sets of configuration parameters just like all TinyTrak3s. One could put a tag on a search-dog vest that's tied to a switch. There could be a label on the tag, something like "Subject - pull this tab!" Then when the dog reaches the subject the subject can pull the tab and we immediately get a different status message
indicating where the dog found the subject.

On many searches the friends and family of the subjects insist on helping. They may not be experienced searchers and may not have the survival skills necessary to ensure their safety in some extreme weather conditions. Our plan is to trade them a Pocket Tracker with attached GPS receiver for their car keys and driver's license at base camp. We'll give them an area to search and ask them to report back at a certain time. If they are overdue, we'll know where they are, or at least where they were headed. When they return to base camp we trade their keys and license for our equipment. Since we have their keys, they can't accidentally drive off with the tracker. If they catch a ride with someone else, we have their driver's license so we can track them down later.

An experienced search manager once told me that where you ask someone to search, where they think they searched, and where they actually searched are usually three different places. APRS clears up the confusion. Often times, if we see a team headed in the wrong area (perhaps it was recently just searched by another team a few minutes before) we can usually contact the team on the radio and correct their course. This type of real time asset coordination makes the entire search process much more efficient.

Some of the searchers carry APRS receiving stations in the field; most often a Kenwood TH-D7A. We can "post" objects by APRS. Someone
radioed in the coordinates of a piece of evidence. We posted it as an APRS object "Shoe" and the teams in the field with APRS receivers
immediately got a picture of where the evidence was found. Many GPS receivers (even my old Garmin II+) support Waypoint Uploading, so the text data on the D7 is displayed in graphic form on the GPS screen. The text "Shoe" appears on my wristwatch GPS in the right place on the map with respect to all the other waypoints and features.

It's not uncommon for one team to finish their assignment and for another team to need help. Using the "Dynamic Go To" feature it's easy for one team to plot an intercept course to another team, even when both teams are

on the move. This works great with the Kenwood D7 on my belt wired to the ForeTrex GPS receiver on my wrist.

You may think that the mountains are a hindrance. I believe we've shown the terrain to be more of a help once you figure out how to use the terrain to your advantage.

I wore a Pocket Tracker while snow skiing one day. The ForeTrex GPS receiver on my wrist was tied to a Pocket Tracker with 3-inch stubby duck on it in my vest pocket. True, not every report made it to the network, but over 60% did, which amounted to hundreds of reports
throughout the day. Since few GPS receivers log altitude tracks the next day I downloaded the raw data of my ski trip from findu.com. I imported this into Excel and was able to create an altitude plot (speed plots too). You could see every ride up the lift and every trip down and I was skiing on all sides of two mountains. Reports made it into the network from a "radio hole" at 5800 feet ASL and from the peak at 7580 feet ASL. Pocket Trackers do work in mountainous and forested terrain.

We've installed digi-peaters in search planes. Even when the weather was bad we could "park" a plane in a high orbit at 10,000 feet over the search area to relay APRS traffic. We've even done vehicle to vehicle to plane to plane to mountain-top to vehicle to base-camp 6-hop APRS paths over a hundred miles.

And people have flown digi-peaters under free floating and moored
weather balloons too.

I worked a multi-day search in a mountainous forested area on Friday and I was given Saturday off and asked to come back on Sunday. It was a 50 mile drive into town. While driving to and from the search site, and while at home on Saturday, I could "watch" the search by monitoring the APRS activity of the 8 Pocket Trackers deployed on that search. As a Search Technician I had a much better idea of what areas had been
covered in my absence and what areas might need more attention.

A Pocket Tracker is about as light at it gets, weighing less than 3 ounces; 5 ounces with antenna and battery, and 11 ounces in the
weatherproof case with antenna and battery. It's simple. After the initial pre-configuration you just turn it on and forget it. Put in a lithium battery and it will run for weeks!

Using APRS cuts the voice radio traffic by about 80% in a typical
search. Even if you are not carrying a tracker the battery in your voice radio will last longer because it draws more current every time the squelch is opened, even if the voice traffic isn't for you. You can leave that extra voice radio battery in base camp and lighten your load. Pocket Trackers usually weigh less than a spare voice radio battery.

And with APRS the search teams can focus on searching and not be
distracted by constant radio chatter on a shared channel.

We had a search recently where someone relayed in some APRS coordinates by voice radio. Somehow the message got scrambled and we sent the rescue teams to the wrong ridge. The family had to spend an extra night in sub-freezing temperatures. Luckily they had a full fuel tank
(stranded in the wilderness with a broken drive shaft after being caught in an early snow storm) or it could have been tragic. If the spotting plane had been using APRS we would have received the correct coordinates and could have reached the family a day sooner. I've operated Pocket Trackers hanging in the inside of the window of a spotter plane. They work great!

APRS might be your best defense in a law suit situation. In fact, there will come a day, if it's not here already, that someone may claim a SAR team is negligent if they are not using APRS as a standard tool to ensure the most efficient search possible.

Every searcher seems to love their own GPS receiver. I haven't found one yet that won't work with the Pocket Tracker. Even the old Garmin GPS 50 built way back in '92 works just fine. That's the great thing about the Pocket Tracker. It lets the searcher use their own GPS
receiver, the one they are most proficient and most familiar with.

Questions, comments, and suggestions are always welcome.

Keep on trackin'! T

Best regards,

Tony - N7MTZ

Subject: [TinyTrak] Search and Rescue

We are working with our local Search and Rescue group in helping them with tracking of their search teams. We have a number of tiny trackers and a hodge podge of GPS' and radios. We would like to standardize our tracking packages. We are looking for something that is simple and lightweight. If anyone has some experience with these in mountainess terrain, your comments would be greatly appreciated. Thanks Derick

357. APRS in Rally Sport races

Yahoo group: EastTNAPRS
Date: 2005-07-20 01:52:32 UTC
From: William McKeehan
Topic: 357 Message: 357

I've been working with a group that does Rally Sport races.

This past March, I went down to Cleveland and ran an APRS station at their net control station for their event down there; there was one vehicle in the woods with a tracker (TM-D700) that I tracked most of the day.

The group wants to use APRS at more Rallies. The next rally they have scheduled is Rally Tennessee on September 3-4. See this web site for more information:
http://www.rallytennessee.com/

If there is anyone interested in participating, I'm sure they can use the help. They will need voice communicators as well as mobile APRS stations.

We are planning a trip to the Linden area on the 6th of August to do a communication survey of the Rally Tennessee.

They are planning to do voice, packet, APRS and cellular surveys with a station at the High School in Linden, site of the Rally Control office and Service Area in the parking lot.

Let me know if you want more information.

It's too bad this rally is that far away. I worked a rally in the Cherokee National Forest several years back with the Ocoee Club. It was lots of fun! We had discussed deploying APRS back then for future rallys, but never heard back from anyone. I had my APRS box there that year too. Nobody knew what to do with it.

The Rally in the Cherokee National Forest was the one that I worked this past March. It will occur again next year and they are planning to use APRS at that event also - I'll keep you updated with information about their plans as I get them.

From: David
Topic: 356 Message: 361

It goes to show you, you don't need all that power to be heard. I never use more than 5 watts on my APRS stations. Besides, that's the lowest power setting on my mobile radio.

This was a great story. Makes me want to go out and buy a PocketTracker, then I saw who the email came from. Nice pitch.

362. Re: APRS at the National Scout Jamboree

Yahoo group: EastTNAPRS
Date: 2005-07-20 16:21:21 UTC
From: William McKeehan
Topic: 350 Message: 362

I was able to watch part of the trip up...but I have not seen either WA4YYM-1 or WA4YYM-9 in the last day or more and it looks like WA4YYM-9 never made it to the intended WA4YYM-1 location.

A few things could be happening. The one thing I know for sure is that your packets are not making it to an IGate. This could be
1) you are not transmitting
2) you are not reaching a digi
3) you are not using a path that will get your packets to an Igate

I saw that on your way up you changed your path - I presume that you were not hearing your packets digi'd, but were hearing other packets and changed the path to something the local digi's recognized.

Last time I saw you was about 1.5 miles North West of Richmond, VA just off of I-64.

I'll be curious to hear about the trip and specifically, the APRS playing when you get back.

365. MS150 tracker question

Yahoo group: EastTNAPRS
Date: 2005-07-20 20:13:24 UTC
From: David Hoffman
Topic: 365 Message: 365

If I were to setup an APRS tracker box, say for use in a non-ham vehicle, and wanted to keep it pretty simple, what connectors would you recommend? In other words, I want to through a tracker in someone's vehicle, say a SAG or maintenance truck, and I want to use their vehicle's battery power and have an external antenna for VHF and the GPS. I'm thinking the cig lighter would be the best place to get 12VDC power from. I want to use mag mount antennas for the VHF radio and the GPS. So that will be three wires coming out of this box. This will be a fairly sturdy, flat plastic box that can be thrown on the floor somewhere.

Do you all think this would be worth coming up with for the MS150? I could possibly build two of these right now without buying any addition parts.

David Hoffman - KE4FGW

366. [Fwd: UX-3 Balloon Mission first planning meeting]

------------------------------------------------------------------------------

Hello all,
Everyone is invited to a balloon mission planning meeting this
thursday evening, July 21, 6:00 PM, at Calhoun's on the River
restaurant, Neyland Drive, Knoxville, TN. Tell them you're there with the
utarc group. This will just be informal discussion of what we'd like to
accomplish with the next few balloon missions, and the possible equipment we
will need. The meeting won't last too long, we'll probably just talk over
dinner. Bring any ideas or suggestions you have for the next few launches,
chases, and experiments. Please call me at 865-599-7361 for directions. I
don't expect the meeting to go more than two hours.
Thanks,
Dan Bowen

367. Re: [EastTNAPRS] MS150 tracker question

Yahoo group: EastTNAPRS
Date: 2005-07-20 20:37:36 UTC
From: William McKeehan
Topic: 365 Message: 367

I wish I had that much equipment laying around :-)

If I were in charge (and I'm not) - I would welcome the two additional trackers. I remember last year that keeping up with the mechanics and the Ambulance was difficult. If they had APRS trackers with them, we would at least know where they are.

I believe that there was a meeting last night where some of the details about the MS150 were discussed. Did anyone attend?

I've also been wondering about having someone fly a digi in a small plane to give digi coverage over the portion of the route where coverage is poor. I don't know if we have anyone with the capability or desire to do it, but it's an idea that I got from reading that e-mail about the PocketTracker.

Topic: 365 Message: 368

I attended the meeting last night where keeping up with the machanics was discussed and this is what got me thinking about doing this. I have plenty of Motorola Oncore GPSs, two spare TinyTrak IIs, two mag mount GPS antennas, plenty of flat plastic boxes to hold everything (depending on the size of the radios), a few spare HTs and a couple of extra VHF antennas and mounts. Except for the mounting hardware in the boxes, I should have everything I need to build up at least two of these units completely.

If I go with the TNC route, I can then make parameter changes remotely and they can also be digis. The TinyTrak IIs would be transmitters only.

369. Re: [EastTNAPRS] K4RWH - Weather Station ?

Yahoo group: EastTNAPRS
Date: 2005-07-21 12:14:59 UTC
From: Rod Humphries
Topic: 363 Message: 369

Ok William, I am using UI-VIEW32, I have a LaCrosse Technology Weather Station..(however I don't recommend anybody buying one, thier techs are lousy CSR's and they don't support anything or any setup you may have.) It is the WS2310, I couldn't afford a REAL one.

Anyway, the WX system is computer friendly with a comport cable, it measures wind, no gusts though, outdoor temp, humidty, rain fall, and indoor temp and humidty. I had to get some MAJOR help to get the data I needed to the UI-VIEW Software. After two days of testing, debugging, etc. we finally got it running and tweaked up. I doubt the accuracy of the system within 10% but that is good enough for me. It seems to be doing quite well.

I'm happy with it so far anyway.

375. APRS traffic counter

Yahoo group: EastTNAPRS
Date: 2005-07-23 22:02:17 UTC
From: richdea2000
Topic: 375 Message: 375

Hello again everyone,

I wanted to post a link to my APRS Traffic counter website. This software logs all traffic as heard on my TNC in Lexington, TN. I know this doesnt really matter to East TN aprs users, but it should give you an idea of the amount of traffic that I can hear. This software also removes duplicates so the traffic count should be pretty accurate. It ranks users by the # of packets heard as well as excessive path lenghts.

Let me know what you think.

As the founder of the Smokey Mountain 10 Meter net 18 years ago, this means that no one in interested in being net control. Unfortunately William it also means that if you are the nets organizer and manager then you get to be the net control if no one else wants to do it. Or the net is dead before it starts.

I know the above sounds harsh. It's also the brass facts. The 10 meter net survived as long as I had the time to call it. When my schedule got to busy and those that had agreed to be net controls lost interest the net died.

378. Hello from West TN

Yahoo group: EastTNAPRS
Date: 2005-07-23 21:56:15 UTC
From: richdea2000
Topic: 378 Message: 378

Hello,

Name here is Richard in Lexington, TN.

I run the KB4YTM-2 Igate in Jackson, TN and I also maintain 5 digi's in and around the West TN area.

Its good to see a new group about aprs as I hope this means its still growing. I just wanted to introduce myself and say I appreciate the approval of joining the group.

I also wanted to let you know that ALL digi's between Nashville and Memphis are setup to the new paradigm settings. No longer is there support for RELAY,WIDE,TRACE and TN.

WIDEn-n and TNn-n are the recommended paths now, with WIDE2-2 getting you to an Igate anywhere in West TN, and TNn-n paths to be used for EOC and other emergency communications and nets.

If I can be of any help please dont hesitate to ask.
Richard

379. Hello everyone!! Introduction

From: richdea2000
Topic: 379 Message: 379

Hello everyone. (2nd introduction, 1st one got lost it seems)

Richard here in Lexington, TN

I just wanted to introduce myself and say thanks for approval to join this aprs group. Its great to see real interest in aprs and lists like this prove its growing every day.

I run the KB4YTM-2 Igate in Jackson, TN and I also sysop a few digi's in the West TN area.

In reading through the archived messages on the group, I noticed several references to path usage especially in the Memphis area. I wanted to let everyone know that all of West TN supports the new paradigm digi settings. RELAY,WIDE,TRACE and TN are no longer supported from Nashville to Memphis. WIDE2-2 is now the recommended settings for home users in this area as it should always get you to an Igate. WIDE1-1,WIDE2-1 should work for mobiles in our area also to get you to an Igate. TNn-n routing is supported and I hope to see EOC and emergency nets on this path to help minimize traffic into adjoining states that dont need or want to see our traffic when they may have emergency traffic of their own that they would rather see.

I pass all NWS watches and warning from the internet to RF via TN2-2 path. So far it seems to work well for keeping the info in the West TN area.

If I can be of any help please let me know.
Thanks
Richard

I've had trouble with tennessee.aprs2.net for a while - so much so that I stopped using it.

The issue that I was seeing when I was using it with my IGate was that messages/positions that my IGate received were not getting into FindU.com, so I changed to indianna.aprs2.net.

After some trouble with that server (it may have gone down one day or something, I honestly don't remember now) I changed my IGate to use rotate.aprs.net:14580

I have not tried to contact the owner of tennessee.aprs2.net...that may be worth the trouble to see if he knows what's going on.

http://tennessee.aprs2.net:14501/ shows that the server is up and owned by WA4RYW.

384. Re: [EastTNAPRS] Hello everyone!! Introduction

Yahoo group: EastTNAPRS
Date: 2005-07-24 13:02:43 UTC
From: William McKeehan
Topic: 379 Message: 384

Welcome to the group Richard.

We have had lots of discussions in this group about paths. The large digi here is running an older TNC and does not support WIDEn-N aliases, so people that travel into our area are generally not digi'd or IGated unless they revert to a path of "WIDE" or "RELAY,WIDE".

As you have pointed out, when we travel out side of this area, we occationally find locations where a path of RELAY,WIDE do not work - Memphis is the only place that I have been in a while that has dropped support for RELAY,WIDE.

This has lead to some confusion for people just getting started in APRS - they read that the path to use is WIDE2-2 and they can't understand why that does not work around here.

My IGate passes NWS messages/alerts for MRX to RF; I use a path of WA4KJH-7 when I gate them because that digi is the large digi and covers most of East TN.

I'm currious; How did you hear about this group? Did you see the bulletins?

Another thing I may mention is that a web site with lots of information about the APRS-IS is:

http://www.aprs-is.net/

A list of servers that you can connect to is:

http://www.aprs-is.net/APRSServers.htm

There's lots more information on this site about the internet side of APRS.

One thing that I would like to point you to is the discussions about an upcoming Rally.

http://www.rallytennessee.com/

The event will be September 3-4 and will be in Linden (Perry County). We are planning a trip there on August 6 to do some testing of the coverage of the area - both voice and APRS; we are considering using a frequency other than 144.39 for APRS. If you can offer us any guidance or assistance, it would be greatly appreciated; just let me know if you're interested and I'll put you in contact with the communictions coordinator for the event.

It's fixed now. The java engine dumped while I was on vacation. My deepest apologies for the brief outage.

I AM interested in finding out stuff like this. All Tier 2 servers are configured identically with some minor port offerings, so they all SHOULD work equally. I'll look into this and see what is going on, as my own gates and servers use the T2USASE server as well.

When configuring your aprs-is connection on your favorite aprs
software, you can always use rotate.aprs2.net

That will always get you to a live server in case the one you are
connected to goes down for whatever reason.

Topic: 382 Message: 390

I just restarted the server with a 400% increase in memory available to it. It is conceivable that the scratch stack could be overflowing (a known bug in Java 1.4.2) and not reporting it, which could possibly explain loss of data or even the crash. I have had versions of this server run 10 consecutive months without need for service, and WAS a bit surprised when it crashed last week. I'll be monitoring it closely, but it should be much more reliable if my diagnosis is correct.

Thanks es 73, - Ed

Yes William, I saw your bulletin about the new group. I have been wanting to start a similar group or at least a web page of West TN activities but its been slow getting that going.

The Rally race in Linden will have poor coverage on aprs. The nearest digi is KD4NOQ-3 about 40 miles north in Waverly.

There is a 145.010 packet node WA4VVX-7 that is just sitting there talking to itself most of the time as there are no more bbs's or hardly any nodes left to keyboard on anymore. You might contact David WA4VVX and see if he would consider changing over to 144.390 at least temporarily for the race. It is located in Lobelville just north of Linden and would provide great coverage for the entire county.

KG4NRC Sean in Nashville was supposed to install a new digi near Waynesboro but that would be about 30ish miles south of Linden, so I dont know how much that will help Perry County either.

You can forward my email to the race coordinator if you like and I will help anyway I can.

Richard

I probably should have said something earlier...but really have not taken the time to really debug to see what could have been causing the problem. I had forgotten that you were in this group or I would have discussed it here earlier.

OK Ed, thanks... I will come back. And I am gonna
try that "rotate" command just for the heck of it to.

Thanks Ben,

I've allocated more resources to the engine, so it should be much more reliable now. I will also be adding memory to the servers, as they also double as IRLP and echolink gateways. Please let me know if anyone experiences any kind of performance issues.

Thanks es 73 - Ed
WA4RYW

396. Moe's APRS system is off the air.

Yahoo group: EastTNAPRS
Date: 2005-07-24 23:30:51 UTC
From: ke4cqw
Topic: 396 Message: 396

Hi all,

Well the grand moving day has come. My APRS station is off line for a while. We are moving so things may be interesting for a while. My ONLY working email for now will be moebrewer@... As I can get access to the internet I will check it but my cell will still be working it is 865-621-9317 the home number might change.... nbot sure yet long story.

73, MOe N4CQW

398. TNC & Sound Card- have your cake and eat it too!

Yahoo group: EastTNAPRS
Date: 2005-07-25 04:28:55 UTC
From: Scott
Topic: 398 Message: 398

I uploaded a file of a schematic of my latest creation. i recently traded my trusty ol Yaesu FT-900 HF rig for an Icom IC-706MKIIG (yippie!). The delima...how to do sound card and TNC modes, and still have good voice audio with out reaching behind the radio everytime I wanted to switch. Hence:

The NA4IT Soundcard Interface / TNC Switch.

The little goody has a built in isolated soundcard interface, a TNC connection, a cable to your rig, and a switch to select SoundCard, TNC, or OFF! In the off position, all wires going to the radio are disconnected, so the voice audio sounds like it should!

Even though it is built in an old com port switch box, there is no com port switch in it, as I run the TNC doing VHF stuff while I an on HF sound card modes (I own an AEA PK232MBX which has Radio 1 & Radio 2.) So, I utilize both comports on my computer. You may have to add a 2 port com port switch, or use USB to SERIAL adapters.

Hope someone finds this circuit useful! I sure have, and once again am enjoying all that DIGITAL has to offer (or most of it anyway)!

Scott, I was looking at the schematic - I'm not much for building stuff, so I may be confused.

BUT

It looks like you have the RIG GROUND and RIG AUDIO IN switched going to the soundcard. Can you have a look and see if I'm correct? If I'm wrong, can you explain the circuit to me a little?

You have a good eye William. In fact, I had it switched going to the rig and the TNC connector. It has since been fixed, and an updated version of the file uploaded.

Thanks for catching that.

From: Scott
Topic: 401 Message: 401

William caught a goof up I had on the schematic in the files section. I also saw one, and did a revision which further isolates the ground on the PTT line.

This is a general diagram, and as stated in the notes on the sheet, is used with an IC-706MKIIG and an AEA PK232MBX. Please check you equipment diagrams and wire accordingly. I take 0% responsibility for any damage this diagram may cause. If I were the one building your switch, I would take full responsibility. The diagram is furnished for those who like to homebrew, one of the dying facets of amateur radio.

Everything looks good. I tried it from three networks in three states and had a RT of no more than 198ms (which was a 21 hop route!!)

406. New to the area..need county maps for VA

Yahoo group: EastTNAPRS
Date: 2005-07-29 00:55:44 UTC
From: Dan Buchanan
Topic: 406 Message: 406

Does anyone have county maps for Virginia? I have maps for TN, NC, GA and SC but I cant find maps for VA. I moved here from Asheville, NC and VA is visable on this map now whereas when iN asheville it wasnt. Also I am no longer using Windows or the AGWPE software and would like some suggestions for a good TNC to connect my serial port to an Azden PCS 4000

In that case...if you have shapefile support compiled in, I may have a map or two for your use. All of my maps are available here:

http://mckeehan.homeip.net/xastirmaps/

The maps that you may be interested are a couple of layers in:

http://mckeehan.homeip.net/xastirmaps/2-TigerDownloads/VA/

In total, there are over 700MB of data for VA in that folder. This included data down to street level mapping.

If you just want counties, then look at

http://mckeehan.homeip.net/xastirmaps/1-USABase/Counties/

Hope this helps!

411. Re: APRS in Rally Sport races

Yahoo group: EastTNAPRS
Date: 2005-08-05 18:41:27 UTC
From: William McKeehan
Topic: 357 Message: 411

For anyone interested, I will be traveling to Linden TN tomorrow to do some pre-run of the Rally TN Area. A couple of us will convoy from Knoxville Saturday morning to the meeting location. If anyone is interested, give me a call 865-387-0017 or shout on 146.94 anytime this afternoon.

Here are the plans:

Meet:
Noon Eastern Exit 143, I-40, Hurricane Mills TN exit, 20 miles from Linden
146.52 simplex call in when at Exit.
Meet in Log Cabin restaurant, near or in Best Western motel at exit.

Work:
Perry County High School in Linden TN is HQ and Service Area and where the rally starts and ends both days. We will run the route as it will be run during the rally. We'll get GPS coordinates and radio checks at each major site, including Controls, Spectator Areas, and any others that seem useful. We'll need to get cell phone signal levels too, so we know where to send someone if there is a need for a private call.

The main interest here is to introduce APRS tracking and display to the rally folk. We'll track the course opening cars and Fast Sweep, or just 4 directly. More if we get local hams who will put their APRS stations in other official vehicles. We'll track competitors, First Car, Last Car, Sweep and Med responders from information on the Safety Net. If we're lucky, we have a projector and screen to display the APRS map in Rally Control.

Topic: 357 Message: 412

Did you all know that there will be a high altitude balloon heading towards Linden, TN at this very same time on Saturday? It is predicted to land out there about 30 miles to the east of Linden, just east of Linden TN.

Check out the website http://www.groovin.net/ke4pjw/balloon/

David Hoffman - KE4FGW

Based on a max altitude of 98,000 feet and an ascent rate of 1000 ft/min and descent of 1300 ft/min (these are only estimates since I don't have any details yet on the balloon weight, parachute diameter and weight or the payload weight):

23 miles at 272 degrees from the launch site.

Landing site lat/lon:
35d 45.594m
87d 20.712m

This is 4 miles WNW of Duck River, TN just north of Highway 50.

- Bill WB8ELK

I'll email out another prediction late Friday night or early morning.

I think I had read about this somewhere else, but had forgotten.

I did not get much time to play with regular APRS stuff yesterday, so I did not see the balloon at all. Most of the time, I was operating on a different frequency.

On Fri, August 5, 2005 3:03 pm, David Hoffman said:

414. Re: [EastTNAPRS] Re: APRS in Rally Sport races

Yahoo group: EastTNAPRS
Date: 2005-08-07 18:19:31 UTC
From: David Hoffman
Topic: 357 Message: 414

It turned out that their main APRS tracker on 144.39 went screwy. We think it had something to do with the WiFi experiment they had in the same payload package. WB8ELK put his APRS tracker as a separate payload on their flight train on 144.34. It turned out that that is what we used to track it with. It landed .5 west of Centerville, TN.

So how did the testing of APRS and cell phones go for the course?

How far was the second payload separated from the primary payload? That may be something to keep in mind for future flights - separate the tracker from the other payload to minimize interference.

As for the testing of the course...

The portion of the course that is North West of Linden had pretty good coverage with the voice repeater - I was hitting it most of the way (with a few exceptions) with only 5 watts and an external 1/4 wave antenna. The APRS portion worked equally well in this section - we used a packet station as the APRS digi is not in place yet; the digi will share the tower/antenna with the packet station that we used as a digi, so the coverage should be nearly identical - maybe better since the digi has just been setup and appears to have a hot receiver (according to the owner - a guy that does radio for the Highway Patrol).

The portion of the course that is South East of Linden did not do as well. We are considering setting up a temporary digi in that area; there are a couple of peaks that can easily get back up to Linden and even to the other digi - maybe they can "RELAY" the trackers from the southern portion of the route. Voice is also going to be a problem on the southern route - they may just position someone near the temporary APRS digi to relay messages from that area back to net control (which will be at the high school).

Cell phone coverage is similar to digi coverage, so we know where some good spots in the southern route where cell phones work and people can go there if they need to make cell calls.

Our goal for the event is to have 4 vehicles equipped with trackers; one APRS station at net control and one or two temporary digi's. The 4 vehicles will be the '000', '00', '0' and 'FastSweep' cars. These cars are "control" vehicles. The 0 cars travel the route after the road has been closed to make sure the route is clear and ready for racing; the 000 car starts off at a very slow speed and is followed by the 00 and 0 cars (after the preceding car has finished the entire route) at increasing speeds with the 0 car running at nearly rally speeds. After the 0 car is finished, the rally cars begin running the route. These cars are in line from fastest to slowest (based on history) and they are started at 1 minute intervals - so they are racing against the clock and should not have to worry about the other vehicles on the route. After the last car starts, "fast sweep" is started 1 minute later. Fast sweep runs at near rally speeds (like the 0 car) and is ran to make sure all cars have cleared the route. By cleared the route - if any cars crash during the route, they have signs to hold up to indicate that the driver/navigator are OK - they may need help to get out, but the rally does not stop, so they sit and wait until fast sweep finished the route. Once the fast sweep car finished the route, the road is open to general traffic. Behind fast sweep is a vehicle

they call "slow sweep" - this vehicle is normally a pick-up truck that may pull some of the stranded vehicles out of the woods; vehicles that need more than a simple pull are left, their location noted to Net Control and their service crew is notified and sent to fetch the vehicle/crew.

Before the '000' car starts, everything must be in place; there are "Start" controllers, "Finish" controllers, spectators, fire/rescue teams that all must be in place. Once the rally can get enough trackers to equip all of these stations, it will be easy to identify where they are and that they are in position.

This rally will be the first rally where this group has used APRS, so the goals are pretty low.

If anyone can come and help out, we need a couple of portable temporary digi's/stations. The more we have, the better; if we have enough trackers show up, we will put them with the other key vehicles that we want to track.

If we really get lots of APRS stations, we would like to transmit some timing data via APRS messages back to net control; this information is used to make sure the rally stays on schedule and to give a rough idea of the vehicle's standings.

The MTARS group has been contacted and will be the primary source for operators, although the rally coordinators welcome additional experienced operators with or without APRS capabilities.

It was separated by maybe 10 feet. It was the next payload right above
the main payload at the bottom of the flight train.

417. Hello from KF4YMC

Yahoo group: EastTNAPRS
Date: 2005-08-08 20:27:42 UTC
From: ff943
Topic: 417 Message: 417

Figured I'd let you know a little about me. I live NW of Niota,TN. Some say it's W. of Sweetwater. I am using old handme down equipment. PC is an old AST Bravo LC4/66d. TNC is a MFJ-1278 Multi gray, Radio is an old Icom IC-27A. Antenna is a J-Pole up about 20' . This is my APRS set-up . May not be much, but I strive to keep it on the air 24/7. I am running UIView 32. I also have an old labtop which I can use in place of the old AST PC.
I also run a second putor for monitoring and experminting with. I use it to try out add-on's and test receive of differant antennas with varing heights. I run UI-View 32 on it with AGWPE hooked to a Icom 2100 that the TXM has gone out on.
Currently I have tried out UI-View add-on's : Waypoints,Paintbox,UI-Mapini, UI-Route,UI-Filter, UI-Traffic,UI-Netact, and UI-WX. Now just because I have tried these out dose not mean I use or understand all of them, and some do not have a practical use for me. But if you like to keep track of WX Station data. ie:K4RHW, and you are using UI-View 32 I would recomend trying out UI-WX.
I do run my Home digi. I have it set to digi Wide1-1,TN,TN, and TN-n. I do not have relay or wide set due to I would double KF4CFO-7 too much, and there are a few around using the "TN" and "TN-n".
Happy APRSing. . . Kevin

419. RELAY,WIDE vs. WIDE2-2

Yahoo group: EastTNAPRS
Date: 2005-08-08 20:43:20 UTC
From: David Hoffman
Topic: 419 Message: 419

My APRS box went to Atlanta this past weekend. It was using an alternating path of "RELAY,WIDE" & "WIDE2-2" every 10 minutes. The RELAY, WIDE path worked well for the entire trip, all the way down to the Six Flags area and back. Only two packets got back to findu with the WIDE2-2 path. And that wasn't until the car was sitting still for several hours just west of Atlanta.

Topic: 417 Message: 420

Kevin,

I'll say welcome to the group!

Most of the computer equipment that I am running with APRS is older equipment also; that's one of the nice things about Linux, it can be configured to run in a minimal environment (kinda like DOS - but waaaaaayyyy better). My equipment is the Kenwood TM-D700 (which is the real radio that I have) and an ICom IC-V8 (yes, that's an HT). The IC-V8 is running 24x7 as the RX/TX for my IGate (KI4HDU-2). I do not operate my IGate as a digi because of the limited coverage area that I have with a short antenna and the 5 watt HT. But my IGate can get to WA4KJH-7 easily with this setup, so it works well to gate messages, etc. to/from the APRS-IS.

You already know about the Sunday night Net's - so jump in and ask questions or tell us about some wonderful things that you are discovering in the world of APRS!

That just goes to show how much work is still needed to get digi's on
the new settings. Looking at a map from findu.com from your area to
Atlanta you pass by these digi's:

WA4KJH-7>APRS,WIDE,WIDE,TN,TN,qAR,KI4HDU-2:!3541.60NT08337.30W#PHG5860/W-R
TRACE/WIDE/RELAY/TN ON COVE MTN.
this one is obviously still on the older settings.

W4LAW-3>BEACON,TRACE,WIDE,WIDE,qAO,WA4YYM:!3512.55NN08516.65W#PHG5830/W-R-T-TN,
Signal Mtn.
this one is also on the older settings.

W4LAW-5>APRS,qAO,WA4YYM:!3444.30NR08501.00W#PHG5630/A=001575/Local
Dalton Relay
a relay only digi

W4LAW-6>APRS,WIDE,WIDE,qAR,WA4DSY:!3428.12NR08517.87W#PHG5630/A=001422/Local
Summerville Relay
another relay only digi

KF4OYS-3>APRS,WIDE,WIDE,qAR,WA4DSY:!3414.14N/08513.72W#PHG7770 ROME GA
DIGI MT ALTO 1356 AMSL
appears to be on older settings

KD4DLT-7>BEACON,WIDE*,WIDE,qAR,WA4DSY:!3342.55NN08410.66W#PHG5463/
near Atlanta but location not in msg text, also appears to be older
settings

N4NEQ-2>APRS,WIDE,WIDE,qAR,AB4KN:!3404.03NN08427.29W#PHG8460/WIDEN-N
Marietta GA rwf@...
another on older settings

So you see, nearly your entire trip consisted of digi's that the
operators have yet to update and are still on the older DUPE causing
settings. Once digi owner/sysops get these things updated you will see

a significant decline in useless traffic (ping pongs, dupes, etc..) and you will start to see stations further away than you are used to seeing on your map, because the QRM level will be lowered to the point where there will be actual quiet periods on 144.390 instead of constant digi transmissions covering up weaker signals with dupes.

Also, on a different note, you seem to be sending out HID packets. Just turning HID off will eliminate these transmissions. These are of no use to APRS and just cause unnecessary QRM. Here is what I mean:
KE4FGW-9>ID,WA4KJH-7*,WIDE,qAR,KI4HDU-2:KE4FGW-9 RELAY/D KE4FGW-1/B

I noticed the extra ID packets coming from my station.? I checked the plain old beacon rate and it was set to zero.? I'll have to find the cause of those and turn them off.? I went to Chattanooga today and noticed that quite a few WIDE2-2 paths of mine got through.? I think they came from the W4LAW-3 digi.? While it was in Atlanta the other day, I noticed that the two WIDE2-2 paths came through N4NEQ-2 as well as the other RELAY,WIDE paths.? So maybe Ralph has done some work on updating that digi.? The W4LAW digi list is quite long.? You know, it was Doug Woodruff that got me started in APRS way back around 1997 or so.? He seems to be the type that would be on top of the latest changes etc.? So hopefully he's looking into it.

424. APRS/UI-VIEW32 Resource Web Page

Yahoo group: EastTNAPRS
Date: 2005-08-15 03:42:01 UTC
From: Scott
Topic: 424 Message: 424

Hey folks,
After doing a program on APRS at the August MCARC (McMinn) club meeting, I have had quite a bit of interest stirred in APRS here. I have added a page to the MCARC website as a resource for download links, simple tasks to do when getting started, and some general tips. It is at

http://www.qsl.net/kf4cfo/aprs/aprs.html

Thought some might need it here also.

Scott, it looks like you did a great job of putting a lot of related things togather in one nice package. I would recommend anyone using (or thining about using) UI-View take a look at the site - it's got links and some helpful setup tips.

426. APRS at the National Scout Jamboree

Yahoo group: EastTNAPRS
Date: 2005-08-16 05:01:35 UTC
From: WA4YYM@aol.com
Topic: 350 Message: 426

Hi Everyone,
Just wanted to drop a line or two to tell about my National Scout Jamboree experience with APRS.
I ran APRS with my TH-D7 up and back to Ft. A.P. Hill, VA, site of the 2005 National Scout Jamboree. Since I was completely full of gear for the two weeks away from home, I used the small handheld interfaced with my Garmin GPS-III+ and a 5/8 wave magmount. I used RELAY,WIDE until I got to VA then switched to WIDE1-1,WIDE2-2 thereafter. Using my TM-D700 would have been more satisfying, but would have taken up more room.
After spending the night in Richmond on the 18th of July, we arrived at the Jamboree site on the morning of the 19th. It was about an hour north of Richmond just East of I-95. Security was very tight and we (my wife and I) had to exit our vehicle for a search and show identification and proof of insurance to the MP's. I thought about whether there would be questions about my radios and GPS, but there were none. I guess we didn't look threatening.
We drove to our subcamp which was in the northernmost part of the Jamboree and found our quarters, Army tents which hold 6-8 people. Fortunately they had electricity so we could have electric fans and lamps. We spent the rest of the day setting up our living quarters which would be home to us for the next 2 weeks. We slept on Army cots.
The following day I set up the TM-D700 and installed the push up mast which was so kindly loaned me by Joe Riner, WD4DES, our local repeater owner. I unscrewed the dual band VHF/UHF antenna from my car and installed it atop the mast with radials for a ground plane up about 35 feet. I set up the radio and laptop, running UIView 32 and digipeater enabled. I was able to use my TH-D7 with GPS around the Jamboree and be seen on the laptop which used Precision Mapping v.5.0. There were several other folks who used my digipeater during the Jamboree, but none were on all the time. During the day I had very little activity seen on the screen, but at night, there were many stations seen, all the way back into TN. The ham station at the Jamboree, K2BSA, did not run any digital modes, but I did use their repeaters on 2 and 440 and visited their station.
There were 40,000 of us there. We had several problems at this Jamboree, including 4 adult deaths from electrocution when a tent pole came in contact with a 30,000 volt power line running overhead. That was about 2 miles from us. We treated numerous blisters and heat exhaustions. We made many new friends and renewed some old friendships. I was the Chief Physician for our subcamp, which served 42 troops and about 2,000 Scouts and Scouters.
My APRS activity was less than anticipated, but I was glad I tried it. I would not go to all the trouble to do it again in that situation. It was a good exercise in portable operation, however.
We left the Jamboree on Wednesday, August 3rd and spent the night in Roanoke then came on home to Cleveland on Thursday. Glad to be back in my own bed and AC. Next Jamboree will be in 2010. Exhausting, hot, but a good service to Scouting.

A QUESTION TO THE SMARTER THAN I. (thats about everyone.)
My question is about hearing KF4CFO-7. I am located about 8.9 miles N of CFO-7. I would think it would be heard direct 99.9%, since I can almost see the tower it is on. But I only can get CFO-7 direct about 75% of the time. This amoung other things puzzle me. Can anyone explain this to me. Thanks, Kevin / KF4YMC

Multi-path comes to mind at first blush. This would depend on your location and the geography around it. Digital communications do not handle multi-path very well whether it is AFSK packet, P-25 digital, or any of the other digital modes. The multi-path can be caused by reflections from nearby ridges, knife-edge propagation, etc. If your on a beam you can sometimes move the beam enough to put one of the reflected signals into a null, if your on an omni directional antenna you may be able to null the signal by moving the antenna a couple of feet. Sometimes you just have to move the repeater. (Oh wait, that's another multipath problem with a P25 system I've been working on for a couple of years.)

The other possibility is that you are within it's cone of silence. This is dependent on the antenna's being used, elevation of both stations, and power levels. But since you are 8.9 miles away from the site I would not place this anywhere in my top 5 suspects.

Another possibility is the either your receiver is just a little off frequency and CFO-7 is off just a little bit in the opposite direction and the difference puts CFO-7 on the edge of your receivers band pass.

Either way, welcome to the magic part of radio.....

There can be a number of reasons for this as previously stated. Let me just throw in a weird experience I have recently had to prove a point. Ever since I have run APRS I have been plagued with a weak carrier on 144.385. My youngest son just moved off to college so I moved my shack from one side of the unfinished basement to his room in the basement that is finished so I would have nicer surroundings. I moved my "shack" all of 15 feet and only had to add 9 ft of coax to my APRS antenna. To my surprise the carrier on 144.385 is now gone. I did not move the antenna only the radio and coax. I know the carrier was not from with in my own home as I still had it with all the power off. Point is this RF is some funny stuff. I will and does do strange things.

Hm.... Would love to see your old operating position with a spectrum analyzer. Both on it's antenna and on the outside antenna. Ghosts are fun to chase. This reminds me of a problem I had several years ago with a 900 MHz digital microwave system. This system had a 400 KHz wide signal, and one day after 6 months of use it quit working. We had -25 db of signal showing on the receiver and everything said it should be working. Finally decided to hook an analyzer to the antenna since we couldn't see any problems anywhere else. Low and behold dead center of the pass band was a 5 KHz wide signal at -20 db. 5 db stronger than the signal I needed to hear. Closer inspection showed that the signal was intermod from an FM broadcast station, a UHF public safety transmitter, with the chief cause being a very dirty 900 MHz paging transmitter. Unfortunately you can't filter out on frequency intermod, especially dead center of your pass band. So the Microwave System had to be abandoned.

In short, RF is a very funny animal and we call it Magic for a reason. So Jeff, your experience with just moving the radio's to a new location in the basement doesn't surprise me. Just adding the 9 feet of coax could have been the fix needed.

I wonder if the additional coax and connector added just enough attenuation to loose that signal.? Perhaps the 9? of coax also changed the resonate frequency of the entire antenna system.

Ideas on KF4CFO-7...
When we installed the new rig, we did check it with a spectrum analyzer, and it was found to be "dead on" frequency, and the audio to be 4.5kc deviation, which was termed by our club president (who owns a paging company and been in the business of "digital" for years) as paging quality audio. (These measurements were made on the air from about 1 mile away.)

Also, the antenna is one of three dual band verticals at the same level on the Athens City Hall tower, and I think (notice speculation here) it is probably oriented somewhat NE. (Each antenna is mounted across from each other on one of the three legs of the tower.)

Kevin may be in a "side null" due to the fact the antenna will have some directivity because of the tower directly behind it. We all know that a beam antenna will have some very deep nulls to it's left and right of it's forward direction.

I have noticed it to be extrememly high in signal strength in the Eastern McMinn, Southern Monroe, and north up to about Vonore area.

That said, John's suspicion of multipath may be true also.

Good question Kevin!

Thanks to all who responded to my question. You answers / suggestions were helpfull in understanding my delima. Now my mind is whirling with ideas of what I may need to do to better my station. First being sure my OLD RADIO is on on freq. Always a possibilaty with an older well used radio.

Thanks John/N4QEA, Your comment on the cone of silence answers another delima I have with another station even closer to me.

Again Tnx to all, Kevin Colvin / KF4YMC

For David's comments about the additional cable causing a loss or retuning the system slightly, that is what I was wondering.

About the comments below. Years ago, ok more than 10, we discovered that the best deviation for a 1200 baud AFSK FM signal was about 3.5 KHz. Meaning 4.5 is a little to hot. The tnc's tend to lock up on the data at the lower deviation faster and more reliably. Second in the Audio on the RX coming off of a speaker jack or straight from the detector? If from a speaker jack that also means it going through de-emphasis in order to tune the audio more to the human voice. 2.2 KHz audio is not in the human voice range as rule. Mariah Carrie might disagree with that statement though.....

The antenna location might be part of this. He may be in a null. Also depending on where he is actually located in relation to City Hall, he could be getting some knife edge propagation as the signal crosses a ridge. In the back of my head I tend to remember some ridges to the east of City Hall. Between the possible Null, and the ridges this is sounding more and more like multi-path. Ok this may sound strange, but try changing the polarization of the antenna 90 degrees.

John Moyers, N4QEA

Subject: [EastTNAPRS] Re: A QUESTION TO THE SMARTER THAN I.

Ideas on KF4CFO-7...
When we installed the new rig, we did check it with a spectrum analyzer, and it was found to be "dead on" frequency, and the audio to be 4.5kc deviation, which was termed by our club president (who owns a paging company and been in the business of "digital" for years) as paging quality audio. (These measurements were made on the air from about 1 mile away.)

Also, the antenna is one of three dual band verticals at the same level on the Athens City Hall tower, and I think (notice speculation here) it is probably oriented somewhat NE. (Each antenna is mounted across from each other on one of the three legs of the tower.)

Kevin may be in a "side null" due to the fact the antenna will have some directivity because of the tower directly behind it. We all know that a beam antenna will have some very deep nulls to it's left and right of it's forward direction.

I have noticed it to be extrememly high in signal strength in the Eastern McMinn, Southern Monroe, and north up to about Vonore area.

That said, John's suspicion of multipath may be true also.

Good question Kevin!

435. Sweetwater Digi- K4EZK-9

Yahoo group: EastTNAPRS

From: Scott
Topic: 435 Message: 435

Well, it is a little closer to being put up. Charlie now is in possession of it, and hopes to install it sometime this week. Because of the TNC it runs, we opted to set the alias as "WIDE" as there can only be one setting in it. I realize that is not the best situation, but maybe it will help a little. It should respond to K4EZK-9 and WIDE (which it did sitting on my desk). It's location should appear on Oakland Rd (Hwy 322) between Hwy 11 and I-75. It's not as high a profile as KF4CFO-7 or KF4YMC (he's doing a GREAT job...I think he digi's Egypt!).

Are we still going with APRS?? I thought we had just a few mobile APRS stations and a bunch of fix digis everywhere.? The only mobiles that I know of are all in Blount Co.? Are there mobile APRS stations south of us that will be running the MS150?

I plan to have my APRS station set up and running at the Conning Market. We can at least check out propogation and still have message capabilities even if no mobile APRS can run the route.

It would be nice to have APRS in the lead vehicle.

A coordination net is going to be on 145.310(-)141.3 Tuesday at 9:00PM.

It may be best to join in on that net to get the offical plans.

I will not be able to participate in that discussion since I am in Memphis (unless that repeater has echo link on it). I am planning to help out at the event and am willing to do whatever is needed. I will have my APRS station if I'm mobile or stationary.

So I Digi Egypt,
Well if your running a 2-way igate, and they come thru as a Wide N-n
or maybe TN or TN N-n then yes, I might digi them.
That is because I am set up as a <LIMITED> Digi. Otherwords, I only
Digi Wide N-n Up to Wide3-3, If a 4-N or larger comes thru I will
digi it but, it will not go any farther than my transmitter will
transmit, I terminated the N-n off of it, so I goes out from me and
dose not get re-digied.
I do not digi out any WIDE or RELAY. I leave that up to KF4CFO-7,
because it would be a real big DOUP PROBLEM.
I have spent numberous hours watching a Black screen with pretty
green letters on it (TERMINAL SCREEN) to see how many Doups I create
with my Wide N-n setting. And I am pleased to say, at least from my
end, I only have what I call Minuminal douping.
As far as doups from TN N-n,, Well no one around here is digining it
that I can tell, But I do, at times receive stations using TN N-n.
One case was a middle TN Balloon, I was diging it. They had TN N-n
Setting. As far as TN, Well I digi 1 station quite often.
Also, KF4CFO-7 dose a good job to it's south along I-75, but desires
much torward the north. I do NO GOOD to the south but can Normally
cover I-75 fron around Niota Exit (56) to the 40/75 Split. So we are
doing little doup there.
I have elevated my Antenna up to 30' vs 20' in hopes to help cover
more to my west,(torward Watts Bar). We have at least 1 mobile unit
that goes over ther regularly and I lose him before he gets to the
68/58 junction.
So if some how Egypt gets digied by me, then that means someone's
running a two-way I-Gate close to me. And Unless I am watching that
Green worded black screen, I'd never know....By the way, it helps
being located on a little mole hill like I am.

444. MS Ride 2005 / APRS / Coordination Net / Info

Yahoo group: EastTNAPRS
Date: 2005-08-23 04:24:27 UTC
From: Scott
Topic: 444 Message: 444

I did announce a coordination net via email to all those who have said they want to participate, and have confirmed that they do. It will be at 9:00PM EDT Tuesday on 145.310(-)141.3, does not have Echolink. The reason for a Tuesday net is so I can communicate to the MS folks any concerns or needs asap. They will probably be coming over here on Friday, That gives me two days to get final plans with them done.

We have 25 hams from 4 counties signed up to work the ride.

William has offered to do one of two things:
(1) Be lead APRS
(2) Work Townsend Elementary

I feel the goals for our part of the ride have to be these:
(1) Safety of riders.
(2) Communications for MS between rest stops, start, and finish lines.

I still do not have a dedictaed station for Townsend Elementary. What we have had to work on is to make sure we had rest stops and things like that covered. That has to be done. We have a group of 8 hams from Chattanooga coming that will be the "sags". One of the things we will discuss tomorrow night (Tuesday) is how to handle Townsend. MS folks will be there at 8:30 AM. Since we don't have a dedicated station there, what we are faced with is a couple of things:

For Saturday: Let the first sag ham be that station when they arrive (12:00 Noon?). If we need to comunicate with Townsend before, we send the assigned person watching the Walland Hwy narrow bridge area to Townsend long enough to do that (2-3 miles away).

For Sunday: Last sag out checks with MS folks to see if they need any last minute comms.

This has been a pretty big concern for me, since Athens and Townsend are their bases of operation. If someone wants to take that stop, please hold up your hand. If no one else does, then I will probably ask William if he wants to do it. I know it makes for a looong day on Saturday. Sunday is not so bad. Everyone else we have is assigned. I have one intersection in Monroe I need covered, but I expect it will be. Everything else is done deal.

APRS...boy, sure would be a nice touch, but I received word that some if not all of the folks that have APRS mobile equipment were going to have to work, etc, so that's why I haven't worried too much about it. Chattanooga bunch doesn't have APRS, McMinn doesn't, Monroe has (1) but does not fully know how to operate it yet, so that leaves the folks in Blount Co. And it's not really fair to ask someone to travel

all the way to Athens both days. I have tried to plan so that only the Chattanooga folks will be in motels, for two reasons: (1) it will save the MS folks money, and (2) the McMinn Monroe and Blount hams won't have to travel very far. I do have one McMinn ham that will "motel" but he is with the MS provided ambulance, and he was assigned to that last year, so no need to change what works.

(For those you who didn't know, Chris KE7GZ "shadowed" the ambulance last year. To communicate with them, since we can't ride "in the bus" he put his HT on thier dash on an unused 440 simplex freq, locked the TX out, and used low power to tell them to stop, go, turn right, etc. This year, he is going to use FRS!)

We may only be able to "test" APRS this year, and next year try to implement it. If so, that's fine. If anybody has any ideas, let me know. I'll check mu na4it@... account tomorrow before I do the net. Or, just check in there tomorrow night. I still have APRS equipment I can put in the trailer, so that is not a problem.

Well Iwas going to mention the bogus data if it was.? But I see you already knew that.? They tested it further once it was recovered.? They ran the APRS tracker with and without the WiFi running.? They even relocated that GPS antenna and still are getting inconsistant results.? They are not sure what is causing that yet.

449. APRS & MS RIDE 2005

Yahoo group: EastTNAPRS
Date: 2005-08-24 21:06:44 UTC
From: Scott
Topic: 449 Message: 449

As far as we know now, we will not be using APRS to track the ride. However, the NCS in the MCARC Trailer and some of the other stations will have APRS up and running. As far as I know, the NCS will be KF4CFO-4 with the BIKE symbol.

Also, Kevin, KF4YMC is going to be the official Skywarn station for the ride. There are forecast some showers and thunderstorms for both days. Since we will have no way to look at radar in the trailer, Kevin will keep a watchful eye and if he sees something of interest, let us know. He may also project objects on APRS detailing where the WX is not good. Kevin has had several years now of being an alternate Skywarn NCS for McMinn & Meigs COunties, and can read radars well.

And he only had to pay a dollar for me to say that!

Maybe next year, we can fully implement APRS for the ride.

If McMinn or Meigs counties have an actual declared WX warning from the NWS, we will move the bike ride to 146.820(-)141.3. Monroe County uses 147.315.

My policy is as far as McMinn & Meigs counties (since I am District 3 Skywarn Rep) is that if no wx warning has been issued, the is NO net called. Traffic can be passed, but NO net is active until we get an actual warning. I don't like crying "wolf" and tying up a repeater for hours when nothing is going on. And there are areas in TN that do exactly that.

Let me know protocol for Blount Co and I'll send the plan out to the ride participants.

OK Moe. If you do have an alternate frequency in mind, that's OK. I just need to let everyone know so they have it programmed in. These rigs nowadays just about have to have the manual to even get into VFO!

Our repeater is used by the NWS also for relay traffic down south to Bradley, Polk, Hamilton, etc. so we try to keep it available.

Let me know if you have a specific frequency. Hopefully if we do get anything it will just be a good cooling shower!

I also agree on the safety of the riders. Probably the only thing we will be able to do is try to get them sagged to a better area. I am truly greatful for all the additional help we have this year. I have been told they expect to have double the amount of riders this year.

Yahoo group: EastTNAPRS
Date: 2005-08-26 20:04:52 UTC
From: Scott
Topic: 459 Message: 459

Here are the plans for APRS and the ride this weekend:

KF4CFO-4 will be the MCARC Trailer at Union Grove Church.

WA4BDS(ID#) will be at Coning Market.
He will also have his home station on as a RELAY digi with call WA4BDS.

KI4HDU(ID#) will be at Townsend Elementary.

KF4YMC near Niota will be the official Skywarn station.

There may be others scattered around. At least this will give us an
idea of what could be possible, and help us out with the wx issues.

461. APRS & MS Scenic Mountain Challenge

Yahoo group: EastTNAPRS
Date: 2005-08-27 22:01:31 UTC
From: Scott
Topic: 461 Message: 461

Well, we found out that APRS for the entire ride is going to be tough. At the church where NCS is located, I set up with my 706 at the highest power level, and kicked in the RX preamp, along with having a 5/8 wave antenna with a ground plane kit at 30 ft high, and could beacon all over the place, but could not get enough incoming signal to decode a packet.

But, all in all the ride coordination has went great this year. APRS would be a nice touch, but the terrain just is going to prohibit it. Guess we could float a tethered WX ballon with a APRS package under it!

73, Scott NA4IT zzzzzzzzzzzzzzzzz

From: David Hoffman
Topic: 461 Message: 462

Your highest power level has nothing to do with it.? It's not the power you're running that puts those icons on your screen.? You need mobile stations transmitting their current position on the same frequency that you are on, to see position reports on your screen.? All you need to do is see if you can hear WA4KJH-7 direct.? Once that's done, you'll see all the activity in the area, right there on your APRS screen.? If you can't hear WA4KJH-7 direst, surely you'll be able to hear WA4BDS's digi from there.? It's my understanding that you had quite a few APRS stations, especially out of Blount Co. out there today, but they were all stationary.? That's not what APRS is all about.? It's about getting the current position of certain stations updated automatically as they are moving about in a given area. We know where the stationary stations are, just get out a map.?? What's your plans for APRS on Sunday?

From: William McKeehan
Topic: 461 Message: 463

I think we need to work on getting a digi that can hear WA4KJH-7 and/or KF4CFO-7 that can be heard at the church if we are going to try to use APRS next year.

The UTARC club is talking about putting up a digi at their shack - that one may actually help as it would be reaching you from a different angle than WA4KJH-7.

Anyone else have any ideas?

Scott, could you hear WA4BDS direct? I don't think you could. When you were sending position packets out (early this morning) via WA4BDS and WA4KJH-7, I was not able to get a message to you. I could easily hit WA4KJH-7 and was able to relay to WA4BDS (I tested this).

Did you hear ANY stations direct while at the church?

Roy, what power setting was your home station running at today?

I thought Roy left his WA4BDS digi up at his QTH for this event.? He doesn't live far from the lunch stop and I'm sure he see WA4KJH-7 just fine.

As I said in the first message I could "hear" stations, but not with
enough signal strength to be abel to decode packets.

I realize running "mobile" is the "thing" for APRS. But also, if it had worked, our Skywarn station for the event, Kevin KF4YMC, would have been able to project objects to us detailing weather problems. There is no way any of us involved in the route could see a radar.

APRS is very useful, but not just for projecting positions of mobiles. It has evolved into one of the best tools Skywarn has.

My power level on WA4BDS digi was 42+ watts on 8-27-05 for the MS150.

WA4BDS-12 at Coning market was 10 Watts except for 40+ watts on early tests.
I had several direct stations at Coning market including WA4KJH-7.

469. Sunday night net

Yahoo group: EastTNAPRS
Date: 2005-08-29 12:47:31 UTC
From: William McKeehan
Topic: 469 Message: 469

We had a good net last night. 12 check-ins with 7 via APRS.

We discussed this weekends event - overall, things went very well.

KF4UVT told us about some expirementation that he had been doing with testing to see if "VoiceAlert" would work radio/TNC combinations other than the Kenwood TM-D700. The results were not what was expected; the radio that he was using was sending squelched audio out the data port.

We also discussed using Radar overlays with APRS software - if you have not tried this, it's a great tool for Skywarn.

Then we discussed an issue that KF4UVT had with his station this past week. In UI-View, it seems he set his path to WA4KJH-7,WIDE2-2 - which would have worked in any other software, but UI-View expects the destination to be the first thing listed in the path. So his elimination of APRS, at the beginning broke things. Something to be aware of if you are running UI-View.

We had a few guys from London, KY join in the net. They are working to build up their APRS stations in that area and have found our net to be very interesting.

With the Rally TN event next weekend I will be unable to participate in the net, so I am looking for someone to take over the net control position. If you're interested, drop me a note.

The net continues to be a source of information for me; I learn something every week. Participation is remaining up, not extremly high, but high enough for me to justify keeping the event on my calendar.

470. Re: APRS Stuff

Yahoo group: EastTNAPRS
Date: 2005-08-29 14:30:45 UTC
From: William McKeehan
Topic: 470 Message: 470

I'm glad that you have found APRS and find it interesting!

Unfortuniately, I do not know of any books that can teach you about APRS. If you are technically inclined, the details of how it all works can be found in the specifications (ftp://ftp.tapr.org/aprssig/aprsspec/spec/aprs101/APRS101.pdf) will tell you exactly how it all works.

Other than that, it depends on the software/hardware that you are using.

Bob, WB4APR, is the creator of APRS and he has a web site that has lots of good information: http://web.usna.navy.mil/~bruninga/aprs.html

Be sure to check out his Fix 144.39 page (http://web.usna.navy.mil/~bruninga/aprs/fix14439.html) to understand why he is encouraging everyone to eliminate the aliases of RELAY and WIDE from the digi's and going to the new WIDEn-N approach. This page also has some details on setting up different TNCs to implement this new approach.

The group that participated in the net on Sunday night has a Yahoo! group (http://groups.yahoo.com/group/EastTNAPRS) where we discuss all things APRS related. This group has a collection of links that can give you lots of information.

One that I would recommend would be http://www.aprs.net/vm/

There are a lot of applications for APRS with Search and Rescue operations. The software that I use, while not the easiest to install, has lots of features that work well in a SAR environment: http://www.eskimo.com/~archer/xastir/SAR.html

There are several groups around the country that use APRS for SAR missions. One of them is the North West APRS group: http://nwaprs.org/sar.htm or http://nwp.ampr2.net/nwaprs/SearchAndRescue

A big part of APRS is having equipment (aka, trakers) to deploy with the people/assets to be tracked. The Kenwood TH-D7 with a GPS is a great small portable solution, but the cost is a little high. A lot of people are using the TinyTrak3 or OpenTraker: http://www.byonics.com/ to get a tracker (with no messaging or receive capabilities) in the field inexpensively.

There are lots of options. Join the group and ask questions there - we have some people in the group that know more about this stuff than I do, so it's a great resource for answers.

Hope this helps!

With tax, shipping and insurance, the total comes to $24.76 for the eBay auction.? ARRL doesn't tell you what the amount of the shipping comes to until after the sale is complete.? They also do add tax.? But guessing from previous orders from them, you'd be paying about the same price either way for this book.? I need some other stuff from ARRL, so I might as well get it straight from the publisher all at once.? Just my thoughts.

474. Rally TN

Yahoo group: EastTNAPRS
Date: 2005-08-30 14:15:42 UTC
From: William McKeehan
Topic: 474 Message: 474

FYI, Rally TN is going to be in Linden TN this weekend.

Volunteers need to meet at the Linden High School Saturday morning at
8:00 AM - let me know if you need directions.

I'm planning to drive out Friday afternoon.

If anyone is interested in helping, please let me know so I can get
your name to the coordinators so they can reserve enough hotel rooms.

I still do not know how many (if any) APRS trackers we will have
mobile for the event.

479. Need little help with UI-View32

Yahoo group: EastTNAPRS
Date: 2005-09-08 14:48:28 UTC
From: kphillip162
Topic: 479 Message: 479

I have this set up and running but not sure what to put for the UNPROT address in the station set up screen. I have my beam pointed toward WA4KJH-7 and hear almost all of my traffic through it. I have tried APRS,WIDE and RELAY,WIDE and APRS,WIDE but the only way I have been able to get messages through and ACKED is by using WA4KJH-7,WIDE1-1.
Is this right? As an example: I have been communicatiing mostly with Kevin KF4YMC and I can get the messages through to him only if I do CTL-R in the digi field of the message box to get the reverese path to him. Do I have to do this for every message I send?. I am also trying WINAPRS and it will automatically send back through the reverse path.

Any help would be appreciated since I am new to APRS and am trying to decide which software I like
73
Kent (KC4TWO)

480. Re: [EastTNAPRS] Need little help with UI-View32

Yahoo group: EastTNAPRS
Date: 2005-09-08 15:09:36 UTC
From: William McKeehan
Topic: 479 Message: 480

If WA4KJH-7 is able to hear you direct, then you should be able to get out with any of the following:

APRS,WA4KJH-7
APRS,WIDE
APRS,RELAY
APRS,TRACE
APRS,TN

WA4KJH-7 will respond to WA4KJH-7,RELAY,WIDE,TRACE and TN. Everything except WA4KJH-7 is a generic "ALIAS" that other stations may respond to as well.

In UI-View, the destination address (APRS in the above) must be included in the unproto address.

The unproto address is the "path" that you want your packets to take - think of it as giving directions to your packet as you set it out into the world.

If you want your packets to travel further than what WA4KJH-7 can talk to, then you need to take one of the above examples and add somethig to the end of it; for example:

APRS,WA4KJH-7,WIDE (this will give you one hop past WA4KJH-7 with older digis)
APRS,WA4KJH-7,WIDE,WIDE (this will give you two hops past WA4KJH-7 with older digis)
APRS,WA4KJH-7,WIDE2-1 (this will give you one hop past WA4KJH-7 with new digis)
APRS,WA4KJH-7,WIDE2-2 (this will give you two hops past WA4KJH-7 with new digis)

In the files section of tis group, you will see a few things that may help you understand paths.

http://groups.yahoo.com/group/EastTNAPRS/files/

1. APRS Digipaths, KF4UIA.ppt
2. Understanding PACKET PATH.doc

By all means, expirement and let us know what results you see. Check with the station that you are chatting with and ask them to tell you how they received your packets.

For example, if you are sending a message to KF4YMC via RELAY,WIDE1-1 and he sees this:

KC4TWO-2>APU25N,WA4KJH-7*,WIDE1-1::KF4YMC :Message{14

then you should be able to simply use a path of RELAY to reach him as the WIDE1-1 has been ignored in the above path.

By the way, it is not recommended to use the WIDE1-1 or RELAY in the path in any position beyond the first position. Most software has the Unproto Address as a seperate field from the PACKET PATH, except UI-View, so in UI-View, you must start your Unproto Address with APRS, then put whatever packet path you want it to use after that.

Feel free to ask more questions to the group!

Thanks for the great explanation. I tried APRS,WA4KJH-7,WIDE and it works fine. Question I have is how many "old" and how many "new" digis are around in this ETN area. I know WA4KJH-7 is "old" (responds to WIDE), but how many of the other surrounding digi's are "old" also? ie. should I end with WIDE to reach another "old" digi further out or should I end with WIDE2-1? I guess it is my choice based on what other digis I hear and which one(s) I want to pick it up from WA4KJH-7?? Do I understand the concept correctly now?

From: William McKeehan
Topic: 479 Message: 482

I'm glad my explanation helped.

You have asked some very good questions.

First, let me tell you how I operate.

From my home IGate, I tend to only beacon using a path of WA4KJH-7. I do this for a few reasons.
1. If any other digi hears me direct, he will not digi my packet.
2. It gives my packet visibility in most of East TN with only 2 packets on-air.

In my mobile, I run a path of RELAY,WIDE. Again - for multiple reasons.
1. RELAY is first because some home stations will respond to this alias and digi my packet - thus helping my mobile station reach a bigger digi when I am in a not-so-good location.
2. When traveling, I may not be in the range of WA4KJH-7, so I use the generic aliases.
3. In cases where WA4KJH-7 hears me direct, I get more coverage with this path; I think this is a good thing because seeing a mobile station is a lot more interesting than seeing a home station that sits idol most of the time.

Why do I not use RELAY,WIDE2-1 or RELAY,WIDE2-2? Because RELAY,WIDE accomplishes what I want it to accomplish - which is to use home stations when I'm out of range of WA4KJH-7 to relay my signal to a bigger digi - and ideally, to an IGate.

So to define the ideal path, you must first understand what it is that you want to accomplish - then look at what path will work.

Now, you asked about what digi's are around and how they work - let's take a quick look and see.

WA4KJH-7 - RELAY,WIDE,TRACE,TN
N4NEQ-3 - ?
KI4HDU-2 - Only responds to stations heard direct (regardless of path used)
KF4CFO-7 - RELAY,WIDE,WIDEn-N
W4LAW-3 - RELAY,WIDE,TRACE,TN

That's all that I see on my map - anyone see any more? Can anyone confirm the aliases used by the digi's that I have listed? Let's keep this thread going and see how many stations/digi's we can list in the area complete with the aliases that they respond to.

If you are running a home station using UI-View, then you can easily support the RELAY alias - digipeater setup, select Enable digi and add RELAY to ALIASES - I would not enable WIDEn-N or TRACEn-N unless you have a high location with wide coverage (thus the definition of a WIDE area digi).

Enabling a RELAY digi would let your station help low powered trackers get
their packets out and to a WIDE digi.

483. I'm on the air - Finally

Yahoo group: EastTNAPRS
Date: 2005-09-09 10:30:59 UTC
From: Ben Sager
Topic: 479 Message: 483

Hello folks,

I was able to get some antennas up yesterday, so I have UI-View operating finally. I am about 4.5 miles East of Maryville just off of 321. More stuff will become operational as I find the right box to unpack!

I have my digi setup with RELAY (for the mobiles) and WIDE#-# operational. If that needs to be adjusted, I can do that. I am hearing WA4KJH-7 direct, so maybe my "RELAY" digi is not needed?

I am primarily monitoring 146.52 when I am in the shack. I am checking out 146.85 and 146.94 as I have time which seems very limited now. :))

It is very nice to finally get moved to East Tennessee!

Welcome to the area! I'm sure you have seen on APRS that you very near WA4BDS and K4RWH.

>
> I have my digi setup with RELAY (for the mobiles) and
> WIDE#-# operational. If that needs to be adjusted, I
> can do that. I am hearing WA4KJH-7 direct, so maybe
> my "RELAY" digi is not needed?

My method of determining if a WIDE digi is needed at a particular location is to ask the following questions:
1) do you hear and can you be heard by multiple digis?
2) can the digi's that you hear communicate consistantly with each other?

If you hear multiple digis that can not hear each other, then a digi in your location is needed.

I think a RELAY digi will always help (or under the new paradigm, WIDE1-1) unless a 1 watt station in your listening area makes it consistantly into a WIDE digi or another RELAY digi.

WA4BDS is running a digi at his location.

Having said all of that, I don't think you need a digi at your location. More digis than necessary only increase the amount of packets on the air and increase the collisions.

As always - this is just my opinion - I am by far not an expert on such matters, so please seek other ideas.

The .94 machine is the "work" machine in the area - i.e., it is generally used for events, skywarn, etc. The .85 machine is the "ragchew" machine - it is very busy all day long with chit-chat, and has very few "nets" on it. Neither machine is owned/operated by clubs. There's also the RACK (Radio Amateur Radio

Club of Knoxville) machines (147.300 and others are linked) which has nets on multiple nights during the week.

More information about a few local clubs and repeaters can be found here:
http://mckeehan.homeip.net/amateurradio/local_repeaters_clubs.htm

485. Possible new location

Yahoo group: EastTNAPRS
Date: 2005-09-09 14:19:39 UTC
From: Travis J. Maclay
Topic: 485 Message: 485

Wanted to throw this out for thoughts. I was considering putting a station on the air at Sevier Heights Baptist on Alcoa Highway. I am the Media Director at the church and am there all the time. This is 5 mins south of downtown on 129.

Not sure what kind of coverage is already up that way, as I have not had my home station up in about 4 weeks. If any, I do not believe there are many stations.

Height would be about 50' and connection to the internet is a possibility. Could this be used somehow creatively to help with the balloon launch on 10/22, as it so close to launch site?

Alternatively, are there any other needs to having the radio that close to downtown? Any other packet needs that we can think of?

Just throwing it out for comments.

Travis

I would setup a station at that location and monitor it for a while - does it hear stations direct that WA4KJH-7 (or some other digi) does not hear? That will tell you if it's a good location for a RELAY (or WIDE1-1 under the new paradigm) digi.

I am of the opinion that there can never be too many IGates, so adding another station to listen and gate packets to the internet would be a good thing even if a digi is not needed in the area.

>

Having more ears out and listening for the balloon would be a good thing - gating those messages to the internet is even better (that appears to be one of their goals).

That area seems to always be lacking in APRS coverage.? I live just south of John Sevier Hwy and don't normally get heard through a digi all up and down 129 there.? Going south, my coverage starts around Hunt Rd.? Going north, I'm not sure, but seems like I don't get coverage until near UT Hospital or so.? I think a digi there at the church would be very helpful.? The launch site might possibly be on the UT campus.? So I think once it's in the air, WA4KJH-7 will see it quite fine.? Just my thoughts.
By the way, have I met you before?? I met someone there at the church when the Health Dept. tested their radios.? I was the ham assigned to that location.

Would this have any effect on the Deal's Gap portion of 129? I've mentioned on this list before that I plan to experiment with using APRS for some of the car events we hold down there.

Depending on the event, we have from 10 to 100 cars sometimes divided into subgroups. It would certainly help coordination if, in addition to having reliable RF digipeating, we could get out to a gateway so the event headquarters could see us.

By the way, I've learned a lot already from this group. Wish I could participate in the 'net, but I live in Charlotte.

I would not think so - the church is up almost in Knoxville at the other end of Blount County.

BUT

WA4BDS has a station up that acts as a digi (some times?) that may give some additional coverage in that area. I don't really know as I have not driven it since WA4BDS came on the air.

490. RE: [EastTNAPRS] Possible new location

Yahoo group: EastTNAPRS
Date: 2005-09-09 18:24:37 UTC
From: Ron McCoy
Topic: 485 Message: 490

Oops, I misunderstood its location.

I had heard that WA4BDS was sometimes active but have not yet been there
since then.

Thanks,

Ron

From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On
Behalf Of William McKeehan
Sent: Friday, September 09, 2005 2:08 PM
To: EastTNAPRS@yahoogroups.com
Subject: RE: [EastTNAPRS] Possible new location

I would not think so - the church is up almost in Knoxville at the other end
of Blount County.

BUT

WA4BDS has a station up that acts as a digi (some times?) that may give some
additional coverage in that area. I don't really know as I have not driven
it
since WA4BDS came on the air.

491. RE: [EastTNAPRS] Possible new location

Yahoo group: EastTNAPRS
Date: 2005-09-09 18:26:54 UTC
From: David Hoffman
Topic: 485 Message: 491

Not quite.? The intersection of Hwy 72 and Hwy 129 is 24.7 miles away at 204 degrees, from this church he's talking about.? That is another area that truely doesn't get enough coverage.

Topic: 485 Message: 492

Now the intersection of Hwy 72 and Hwy 129 is 10.2 miles away at 217 degrees from WA4BDS.?
I would bet that the Look Rock area and Foothills Parkway mountains would block WA4BDS from Deals' Gap.

Mercy William, I have to say that never in my amateur radio life have I been told that my help was not needed and never did I think it would happen in an open forum either. But I hear you loud and clear. The digi is off and I am sorry if I messed up your plans on what would be operating on your network. I can see now that I should have asked you what I might do to help out here first as others are doing. Oh well, live and learn. I have been preoccuppied with other things the last couple months and just screwed up.

Ben

Well, I will throw my two-cent worth in... As far as his digi using Relay and/or Wide, I would agree with William on how to see if it is needed. As far as Running the Widen-N, I think he should. As we all know the Widen-N is not covered in or close to Knoxville. And having a digi that will relay it out will give anyone using the Widen-N a better chance to get to the I-Net. If the Knoville stations that could set there digis for the new parameters would, it will at least give the passerthroughers a chance to be seen by those of us who are not APRS INTERNET CONNECTED. I am a RF type of person. (mainly because at 9.8kbs you get kicked off a whole lot). But then again, Maybe I missed the boat, is APRS all about the internet ? Trial and error is the best teacher I ever had, and testing out a new digi location is just that. It may and then may not be usefull. And all the opinons in the world will not prove a thing. Setting up and testing it will be the filling in the pie.
Some of you know I was running my digi, I had it set for Widen-N upto 3-3, TN, and TNn-N. Even though I am close to KF4CFO-7 (a fillin digi) I was diging and covering areas it was not able to. And Yes there were "some" doups. but all in all It was usefull. I have decided to take it off the air for a while, so I can remonitor the area traffic and see if it is still needed.
Everyone see's things thru differant eyes, So there is my two-cents worth. Kevin / KF4YMC

From: Travis J. Maclay
Topic: 498 Message: 499

Kevin,

I would suggest that you join the chat group specifically created for balloon news & updates. You can send a message to majordomo@... and in the message body, place only the words "subscribe chat" and leave off the quotation marks. You will receive a confirmation message, which you then will need to reply to without changing any of the message.

After doing this, you will be subscribed to the chat@... list, which is where most balloon news & updates are shared.

For starters, however, the balloon launch is scheduled for Saturday, October 22. Target time has been mentioned to be 10:00 a.m. or so. Launch site, at this time, is UT campus. Next balloon meeting is to be determined. Probably two weeks or so from now.

Hope this helps.

Travis

Don't get me wrong - I did not mean to say that your help was not needed...just that I do no think a digi in that area is not really necessary. If I have offended you - I sincerely apologize!

The last line of my e-mail said:

>> As always - this is just my opinion - I am by far
>> NOT an expert on such matters, so please seek other ideas.

I trust that you will do exactly that and get input from some others - as well as using your own judgement (how long have you been using APRS - I'll bet it's longer than I have).

This is not my network - it's our network, so if you think a digi in your location would help, then by all means, fire it up (and if you think my digi/IGate is unnecessary, feel free to tell me so).

From: ff943
Topic: 433 Message: 501

Well I would join another group if I was that interested, but on
our group page I read somewhere that local events ie: ballon launches
would prob. be posted,,oh well ...

and heres what comes back to that link you mentioned.. again oh well..

Hi. This is the qmail-send program at extsmtp3.localnet.com.
I'm afraid I wasn't able to deliver your message to the following
addresses.
This is a permanent error; I've given up. Sorry it didn't work out.

<majordomo@...>:
64.94.136.197 does not like recipient.
Remote host said: 550-"The recipient cannot be verified.
Please check all recipients of this
550 message to verify they are valid."
Giving up on 64.94.136.197.

But I do thank you for giving me what I ask for, "the balloon
launch is scheduled for Saturday,October 22. Target time has
been mentioned to be 10:00 a.m. or so." thats all I really wanted
to know.

Kevin / KF4YMC kf4ymc@...

William,

Apology accepted. As we all know sometimes emails are not taken as the writer meant them to be taken and I think this may have been the case here, along with the fact that I have not been able to sleep well and it has been run, run all week.. Which means that I was very tired and had a duller than normal mind yesterday afternoon.. I thought I was still in Northern VA for a moment.. :)))

Anyhow, I had intended to relax and see what was happening on the APRS network this weekend and adjust my station accordingly. I should have made that clear in my original msg. I am a team player. I currently only digi my callsign and WIDE#-#. This should work but it can be changed. As I said, I will look and see this weekend.

Yes, I have been with APRS a long time. I ran DOS APRS for several years and then went to WinAPRS, which I still like. I use WinAPRS on my laptop when I travel. I had brief experiences with a couple other flavors and finally found UI-View which clearly has the most bangs for the buck.

I am a digital person by nature, so I need to look into that around here, and I want to chase satelittes now also... so I have lots of stuff to get working now that Metro Communications has my antennas up.

This is a load off of my mind. I want to see more people in the area using APRS and to think that I may have ran off someone with your experience was not sitting well with me at all.

I will be interested to see what other digis/stations you are able to hear direct. I would also be interested to see if you hear any stations direct that the big digi's do not hear. In the area where you are, a few feet (it seems) one way or the other can dramatically change your coverage area. So it will be interesting to see the analysis.

You are not alone with your choice of UI-View in this group. I think UI-View is the most commonly used software in the group with APRS+SA holding second place. I'm an odd-ball and run Xastir.

Chase satelittes - I don't think we've discussed that in this group before - maybe you can tell us a bit about it. I imagine there would be a lot of people that would be interested if we just knew enough to know where to start.

Ben,

You are being a bit modest in your summary of your skills.

I think your work with the VA Digital Emergency Network would be of interest to most on this list even if it's not 100% APRS. To me, APRS is only the tip of the iceburg as to what can be done with the digital modes and I would love to learn more about what you had setup in VA and how much of it you think would be usefull to implement in this area.

Why don't you share a bit with us (certainly, when you have time - I know moving can be a headache).

Thanks!

As a new APRS person (less than a month), I may as well throw my 2
cents worth in.
I am simply amazed at the talent in this group and the class displayed
by it's members.
I hope that before to long, I will actually understand what you guys are
talking about!
William has volunteered to teach me APRS 101. After a couple Sunday nite
nets and reading
posts here, it doesn't give me much reason to get back on 75 meters.
Thanks to everyone for sharing their expertise.

Subject: Re: [EastTNAPRS] I'm on the air - Finally

Ben,

You are being a bit modest in your summary of your skills.

I think your work with the VA Digital Emergency Network would be of
interest to most on this list even if it's not 100% APRS. To me, APRS is
only the tip of the iceburg as to what can be done with the digital
modes and I would love to learn more about what you had setup in VA and
how much of it you think would be usefull to implement in this area.

Why don't you share a bit with us (certainly, when you have time - I
know moving can be a headache).

Thanks!

William, per your request. I am copying KG4GUL-3, WA4BDS AND WA4KJH-7 direct here. Sometimes I am copying K4RWH direct but not all the time even though it shows he is only 5 miles away. Maybe it has been having a problem over the past 24 hours? I have seen several cars direct as well today as people run back and forth to the mountains.

Overall, the network that I can see from here does not seem even close to being overloaded nor overworked, and seems to function well.

No David, not that I remember and I just checked
again, I get it off of WA4KJH-7.

I am getting K4RWH off of that digi sometimes as well.

Another thing that I find interesting to look at which station do you see that is the furthest away and what path did that station's packet follow to get to you; since we both hear WA4KJH-7, I suspect we both have the same thing as the furthest station:

KC4WZO-2 some 159 miles at 336deg from me via 3 hops
KF4OSY-3 some 152 miles at 218deg from me via 2 hops
KI4FYY-9 some 103 miles at 135.6deg from me via 3 hops
W4WTN some 96 miles at 275deg from me via 2 hops

Let me share my direct station list as of 09-10-05 10:17PM

Station Miles Bearing
W4FXO-3 118.0 63
NT4UX-2 111.7 277
KF4CFO-7 37.2 244
KF4YMC 33.1 257
N4NEQ-3 31.9 159
WA4KJH-7 21.2 89
KC4ASF 7.5 55
K4RWH 3.1 25
KG4GUL-4 1.3 1.3
KG4GUL-3 1.2 1.2

When conditions are better I hear others direct but that is all tonight.

My most distant stations are KC4FIE-8 242.4 Miles @ 303 deg
NV4B-6 234.9 250
KC4FIE-4 223.7 300
K4HY-10 223.7 310
73's
Roy WA4BDS

W4LAW-3 is down near Chattanooga - are you hearing him direct?

I wonder what path Ben's packets may be taking to end up there? Any ideas Ben?

Q: W4LAW-3 is down near Chattanooga - are you hearing him direct?
A: No
Comment : (KC4ASF>APU25N,W4LAW-3*,WIDE2*) by the path I received
the last station with an " * " behind the call would be who I
received the packet from. So it came to me via " Wide2* ".
Normally for me this would mean it came from KF4CFO-7 or WA4YYM...
Stations from the south of me with a WIDEn-N path normally come to
me via there two stations. But not always. So this would be an
assumption only.

I do not hear this guy and I'm much closer (you think this means I need a real antenna?). And with the path that he's using, I don't even hear him via a digi.

> NT4UX-2 111.7 277

I think this is a high-level digi on Short Mtn. He should have a wide coverage area.

> KF4CFO-7 37.2 244

I would bet that this guy is using the new WIDEn-N stuff, coming to you via some Nashville AREA digi, and finally via the NT4UX-2 digi to you. Am I correct?

> NV4B-6 234.9 250
> KC4FIE-4 223.7 300

Interesting stuff to me. It looks like all of the distant stations that you are seeing are using the new WIDEn-N path's. I imagine that when WA4KJH-7 supports the new WIDEn-N stuff, that we will all begin to seee these distant stations and probably more.

From: ke4cqw
Topic: 516 Message: 516

I am playing with UI-View 32 on my laptop as a internet connection only system... I have a operational RF system now I can use but I was thinking about having another system that can be used at a WiFI hot spot or some place where digial communications might need be but no RF is availabe to use.

Here are my problems... I am using the APRS server system... any recommendations on which ones... the list is large.

The big one is this, I can see the traffic and I am getting stations to plot on the map but I am not "transmitting"... watching the rf station.. which uses both the internet and RF. Any suggestions on what I have done or not done? I know when I had Xstair running William was kind enough to write a script program that allowed me to transmit via KI4HDU-7 before I had RF working.... do I need to go and have the same thing don again?

Thanks for the help

73, Moe

Have a look at this list:
http://www.aprs-is.net/APRSServers.htm

It is recommended that you connect to a "tier 2" server; these are all named something.aprs2.net. There is one tennessee.aprs2.net that geographically should be close to you.

I would suggest that you connect to a "filtered" port, typically 14580, and only get stations from an area of interest to you. See
http://www.aprs-is.net/javAPRSSrvr/javaprsfilter.htm
for an explaination of the available filters.

> what I have done or not done?

The typical setup for an IGate is to NOT transmit internet pakets to RF - the internet bandwidth is a little larger than the 1200 baud available on RF and transmitting stations from the internet to RF would quickly clog the RF network.

HOWEVER, messages will generally go from the internet to RF via an IGate (which ever IGate has heard the station that you are sending a message to). Along with the message, a posit packet is normally also sent. Of course, this all depends on the sophistication of the IGate.

> I know when I had Xstair running

In the IGate software that I run, I can specify special stations/objects that I want to gate to RF - I simply added your name to that list for a bit. I currently gate anything with an MRX prefix.

W4FXO-3 has a hearing problem which will not be fixed at the present site. We, after 20+ years, are being evicted from the site which is now controlled by the Carter County Emergency Services(?), for not being compatible and for interference with a new 146.76 un-coordinated repeater. The Digi will be removed from the 4300' mountain top on Tuesday and put back into service as a W/R/T at Blountille, TN and hope we can reach WA4KJH-7 and get out of our "black hole"

520. Re: [EastTNAPRS] Stations Heard Direct Here.

Yahoo group: EastTNAPRS
Date: 2005-09-11 16:56:27 UTC
From: William McKeehan
Topic: 506 Message: 520

Just as an FYI, the path that you are currently using appears to be WIDE2-2.
With that path, even if WA4KJH-7 hears you, he will not digipeat your packets.
WA4KJH-7 does not yet respond to the new WIDEn-N aliases.

On Sun, September 11, 2005 12:40 pm, Charles Whicker said:

521. Re: [EastTNAPRS] Stations Heard Direct Here.

Yahoo group: EastTNAPRS
Date: 2005-09-11 18:47:54 UTC
From: Ben Sager
Topic: 506 Message: 521

I know someone has probably got this list somewhere
and I would like a copy of it or told where to get
it.. I would like to know what is where as far as the
digi's and what aliases they support. Can someone
help me?? I am interested in East Tennessee stuff.
Has anyone ever thought of "naming", as in an alias,
for these digi's so that folks such as myself who
don't know one mountain from another here might find
it easier to orientate the digi's on a map? I am
geographically challenged sometimes! :))

Thanks
73
Ben

I am so far behind on my emails William! I don't here
LAW direct, he is coming off of good old WA4KJH-7 as
is 95% of my heard list. Darn, how can someone who is
sitting at 1,086' AMSL plus the antenna height be in a
hole??

524. RE: [EastTNAPRS] Useless Imformation ?

Yahoo group: EastTNAPRS
Date: 2005-09-11 19:45:31 UTC
From: John Moyers
Topic: 512 Message: 524

Ben, I think it's called HAAT. I haven't been following the thread very closely, but there are places in East Tn where 1,400 AMSL is 1800 feet below HAAT or more. If this is down on Alcoa Highway 1,086 is just about average terrain. Meaning your going to need about 200 feet of tower just to hear down towards Athens and Cleveland direct, provided what your listening to is on a 3,000 foot mountain. I've been working on some coverage issues with some sites of similar elevations and to get the coverage we have to have on one site at least a 300 foot tower as a minimum.. Needless to say the site was determined as non-feasible.

WA4KJH-7 works so well because it is at 2,000 feet HAAT

As will we all! You do hear WA4BDS, so you should be seeing some packets via that route; he seems to hear a couple of digi's to the West and would bring in some traffic from there. WA4KJH-7 is the only digi that I hear, so if he goes off the air, I will be totally alone.

I think KF4UVT or N4CQW may hear the digi in KY - KF4OWQ-2, but I don't think either of those guys is currently setup as a digi...

527. Re: [EastTNAPRS] Stations Heard Direct Here.

Yahoo group: EastTNAPRS
Date: 2005-09-11 19:53:11 UTC
From: William McKeehan
Topic: 506 Message: 527

The digi's that I am aware of (I know this is not all in East TN):

WA4KJH-7 - RELAY,WIDE,TRACE,TN
KF4CFO-7 - RELAY,WIDE,WIDEn-N
W4LAW-3 - RELAY,WIDE,TRACE,TN
WA4BDS - RELAY,WIDE,WIDEn-N
N4NEQ-3 - RELAY,WIDE,TRACE,TN
KF4OWQ-2 - ?????
WO4U - ?????

IGates:
WA4RYW-1
KI4HDU-2

There are other digi's up near Greene county, but I don't have them on my map and don't remember their callsigns. They generally support WIDEn-N, but I'm not sure if they also support the older RELAY and WIDE. There may also be more IGates, but those are the two that I am aware of.

If everyone followed Bob, WB4APR's advice and used overlay's the way he has suggested, then the following chart would help a newcomer understand what is supported by looking at the icon and overlay that digi's transmit.

OVERLAY DESCRIPTION
R RELAY only
W RELAY and WIDE
T RELAY,WIDE and TRACE
N WIDEn-N (and relay,wide and trace) and NOID is set
I (and relay,wide and trace) but ID is set to ON
J WIDEn-N and no others supported
U UI-DIGI firmware
S WIDEn-N and no others supported

My opinion is that everyone with a full-time internet connection who can and is willing should run an IGate. IGates give RF stations access to a high-speed backbone that can quickly and reliably deliver messages literally around the world.

I also think that every home station who can should enable the RELAY (and the "new" RELAY, WIDE1-1) digi. This will give lower powered stations in your area who use a path of "RELAY,something" a better chance of getting to the WIDE area digi's.

The way I have my home digi setup is a little different. I use javAPRSSrvr. In there, I have it configured to use a thing called "No Source Routing" (see:
http://www.aprs-is.net/nosource_routing.htm
for details). The way I have it configured, any station that I hear direct

(which is generally only some vehicles driving past me on I-40), I will digi - replacing whatever path they had with one that I know will work in the area - specifically, WA4KJH-7. We have a lot of people passing thru that are using the new WIDEn-N stuff which is not supported by WA4KJH-7. With my setup, if I hear them direct, I will relay their position via WA4KJH-7 so that they can be seen by anyone that can hear WA4KJH-7.

Once WA4KJH-7 is upgraded to support WIDEn-N, then I will go back to being a simple RELAY and WIDE1-1 relay digi.

Being an IGate, my station will broadcast any message that it receives via the internet which is addressed to a station that my station has heard in the last 30 mins. I use a path of WA4KJH-7 on these messages. This will let me (or anyone) send a message on RF in Memphis (or anywhere really) to anyone in the range of WA4KJH-7. The message will travel on RF to a local (in this case, Memphis) IGate, then via the Internet to my IGate, KI4HDU-2, and finally back to RF to the party that I was sending the message.

UI-View can easily be configured to be both a digi and an IGate. If you need/want the flexability to do something strange like I have done, then you will need something more than the default UI-View, there may be a UI-View add-on to do it, but the most popular packages are javAPRSSrvr and Digi_Ned (http://www.qsl.net/digi_ned/).

From: Ben Sager
Topic: 512 Message: 528

Thanks for the response John. I am about 5 miles East
of Maryville slightly off of 321. Your answer makes
sense. So I might have some hearing problems here. I
can access the AF MARS repeater on some mountain down
at Athens with the mobile using a 1/2 wavelenght and
50 watts AOK sitting in my driveway though.

William;

My digi only responds to WA4BDS and RELAY.

The only area that I can help is South West from here down close to the mountain.

I can change that if the group thinks that something different would be useful.

531. Re: [EastTNAPRS] Useless Imformation ?

Yahoo group: EastTNAPRS
Date: 2005-09-11 22:52:15 UTC
From: Jeff Yawn
Topic: 512 Message: 531

I can not hear KF4OWQ at all. I am down in the shadow from several ridges to the North. HOWEVER, I am planning a DIGI that should pick up a large part of the traffic from up that way as well as most of East TN. I have everything ready just waiting for the snakes to go away for the year before I go up there. It's a very remote site at around 3200 ft. No one will be lonely, there WILL be a back up. It could be on the air at a lower site with in an hour but with substantially less coverage. Everyone pray for cooler weather, I HATE SNAKES.

BTW,
Ben, Welcome to East TN. You and I spoke sometime back. I think, Steve Waterman K4CJX got us together earlier this year when you were still planning your move. It has been kinda busy around here lately. I work with the Red Cross a lot and have also been active on the Emergency Nets for the Katrina Disaster area. Still lots to do but we'll work it all in somehow.

Jeff Yawn
KF4UVT

William McKeehan wrote:
As will we all! You do hear WA4BDS, so you should be seeing some packets via that route; he seems to hear a couple of digi's to the West and would bring in some traffic from there. WA4KJH-7 is the only digi that I hear, so if he goes off the air, I will be totally alone.

I think KF4UVT or N4CQW may hear the digi in KY - KF4OWQ-2, but I don't think either of those guys is currently setup as a digi...

Hey Ben, this is APRS. Just use your favorite mapping software and allow all the digis to be mapped out right on your screen. (I'm hoping to poke some humor in this thread).

From: John Moyers
Topic: 512 Message: 534

Jeff, What's a few snakes?? At the site with WA4KJH-7 and WA4KJH 25/85 repeater we normally have to deal with snakes. For the last 15 years it's only been a black snake that we have kept on the site. (Mouse control.) However, about 3 or 4 years ago we started having problems with Copperheads and Rattle Snakes. Radio repair is so much fun when you have religious experiences as you reach into a cabinet only to find a Copperhead inches from your arm. Thank goodness the temp in the building was around 50 degrees that day. We have our worst snake problem in the cold months. The snakes come in for the warmth and will seek out a warm radio cabinet and power supply along with the mice.

The Black Snakes don't bother me in a site, but I can live without the Rattlers and Copperheads. All this reminds me, it's about time to make another trip to the mountain and check on KJH-7 before winter gets here.

Subject: Re: [EastTNAPRS] Useless Imformation ?

I can not hear KF4OWQ at all. I am down in the shadow from several ridges to the North. HOWEVER, I am planning a DIGI that should pick up a large part of the traffic from up that way as well as most of East TN. I have everything ready just waiting for the snakes to go away for the year before I go up there. It's a very remote site at around 3200 ft. No one will be lonely, there WILL be a back up. It could be on the air at a lower site with in an hour but with substantially less coverage. Everyone pray for cooler weather, I HATE SNAKES.

BTW,
Ben, Welcome to East TN. You and I spoke sometime back. I think, Steve Waterman K4CJX got us together earlier this year when you were still planning your move. It has been kinda busy around here lately. I work with the Red Cross a lot and have also been active on the Emergency Nets for the Katrina Disaster area. Still lots to do but we'll work it all in somehow.

Hi Jeff,

Yes, we did meet through Steve. I thought the move
would never happen at the pace the paperwork was
going! BUT I made it and I am now waiting on other
people to do their thing so I can put together my ham
station, that is in boxes all over the house...

540. RE: [EastTNAPRS] Possible new location

Yahoo group: EastTNAPRS
Date: 2005-09-12 15:08:12 UTC
From: William McKeehan
Topic: 485 Message: 540

What are your thoughts about N35 35.009, W083 01.536?

It's up at about 2600 feet or so. It seems to have a reasonable view down 129 toward deals gap (I do not think it would cover it all by any stretch of the imagination). It also looks like it has a reasonable view toward Tellico Plains, Madisonville, etc. I think it's just outside of the National Park boundary.

On Fri, September 9, 2005 2:39 pm, David Hoffman said:

541. FYI: Using RELAY or WIDE1-1 in a path

Yahoo group: EastTNAPRS
Date: 2005-09-12 15:22:26 UTC
From: William McKeehan
Topic: 541 Message: 541

Over the past little bit, I have noticed some people using RELAY or WIDE1-1 in their path somewhere other than the first hop.

This is not a good idea. Here's why:

RELAY and WIDE1-1 digis are home sites. In some areas, there are MANY of them for each central big digi. We have some in our area. If RELAY or WIDE1-1 is used as the first hop, then the mobile only hits one house, and then the big digi.

If WIDE1-1 is used as a 2nd or later hop then it keys up EVERY RELAY/WIDE1-1 digi in the range of the central big digi for MAXIMUM QRM and nothing gets through.

For more information, see:
http://web.usna.navy.mil/~bruninga/aprs/relayFIX.txt
or
http://web.usna.navy.mil/~bruninga/aprs/fix14439.html

I will try to keep the information about the balloon posted to this group.

Last I heard, all they have definite is the launch date (which I suppose is subject to change). As such, I have added this to the EastTNAPRS group calendar.

For the most up-to-date information, you will want to see the UT Amateur Radio Club web site (http://www.utarc.org) as they are the ones coordinating the event.

To stay up-to-date with the latest discussion, their web site says:
<quote>
If you would like to be notified of future balloon operations, please send an email to majordomo@... with "subscribe balloon" in the body.
</quote>

To be involved in the discussion/planning of the launch, you will want to join the chat mailing list. You should do this by sending an email to majordomo@... with "subscribe chat" in the body.

I'm not sure why you had problems with your earlier e-mail to majordomo@....

Cockspur Knob N35 35.009, W084 01.536

Looks like a long walk from the Power lines that cross the mountain.

Visible from my house. It would cover this section of Blount County
very well.

547. What am I overlooking ?

Yahoo group: EastTNAPRS
Date: 2005-09-12 16:59:37 UTC
From: ff943
Topic: 547 Message: 547

What am I not seeing here ?
This is just an excerpt from my terminal log during a qso with Roy, WA4BDS.
As you can see this is Me replying an ACK back to Roy.
My message digi path was set as WIDE2-2. As well as my beacon path. (as an experimental try).
I seem to be overlooking something here.
I do get Roy direct. and I think he uses WA4KJH-7,WIDE to beacon out.
I am not sure if he had a message digi path set or not, or if he uses default route.
But I am seeing way to many ACK's being sent out from me, Especially the one coming via NT4UX-2 on Short MT (That's close to Woodbury, TN).
Other than not using WIDE2-2 to talk local, What am I not seeing here?
Ack's are normally auto TXM out and I show TXM 4 times on 1 Msg. Acknowledgment
And Moe, Voo-Doo and Witchcraft is not the answer. hi-hi-

Misc info: I do get WA4KJH-7 and KF4FCO-7 and WA4YYM direct.
CFO-7 and YYM do respond to WIDEn-N

```
10:01:51T KF4YMC>APU25N,WA4KJH-7 Port=1 <UI C Len=17>::WA4BDS :ack35

549. Re: [EastTNAPRS] What am I overlooking ?

Yahoo group: EastTNAPRS
Date: 2005-09-12 17:14:40 UTC
From: William McKeehan
Topic: 547 Message: 549

Here's my analysis:

> 10:01:51T KF4YMC>APU25N,WA4KJH-7 Port=1 <UI C Len=17>::WA4BDS :ack35
> 10:01:54T KF4YMC>APU25N,KF4CFO-7,WA4KJH-7 Port=1 <UI C Len=17>::WA4BDS :ack35
It looks like the two ack's above are what your station sent. Note the 'T' after the time.

> 10:01:56R KF4YMC>APU25N,WA4KJH-7* Port=1 <UI C Len=17>::WA4BDS :ack35
Here, you hear the :51 packet digi'd by WA4KJH-7

> 10:02:00R KF4YMC>APU25N,KF4CFO-7*,WA4KJH-7 Port=1 <UI C Len=17>::WA4BDS :ack35
And here, you hear the :54 packet digi'd by KF4CFO-7

> 10:02:01T KF4YMC>APU25N,WA4YYM Port=1 <UI C Len=17>::WA4BDS :ack35
> 10:02:02T KF4YMC>APU25N,WIDE2-2,WA4YYM Port=1 <UI C Len=17>::WA4BDS :ack35
This looks like two additional packets that you sent. This may have happened because you received the message again via a different path.

> 10:02:07R KF4YMC>APU25N,WA4YYM* Port=1 <UI C Len=17>::WA4BDS :ack35
Here you hear the :01 packet digi'd by WA4YYM

> 10:02:31R KF4YMC>APU25N,WA4KJH-7,TCPIP,KQ4TV-3,NT4UX-2* Port=1 <UI Len=56>::WA4BDS :ack35
This packet looks like a non RF packet. I'm not sure I understand this one at all.

What software were you using at the time that you captured these packets? Are you RF connected only or do you also have an internet connection? Do you have the message that Roy sent you? Did you see multiple copies of his message (perhaps via different paths) in your terminal log?

wrote:
> Here's my analysis:

Q:What software were you using at the time that you captured these
packets?
A: UI-VIEW (the Terminal option)

Q:Are you RF connected only or do you also have an internet connection?
A: RF ONLY

Q:Do you have the message that Roy sent you?
A:Sorry I do not.

Q:Did you see multiple copies of his message
(perhaps via different paths) in your terminal log?
A: I didn't truthfull pay attention, But I think I did at times.

Thanks William, If I look at it that way it makes more sence to me.

Thank you Roy, I stand Corrected: Roy uses Relay Wide, vs what I
thought.

I also checked my message retry settings, They are set at 2 tries @ 20
seconds.

551. [EastTNAPRS] Changed digi path

Well I like the spot. It has some shadows through-out the Dragon there, but it looks like it would be a great location for a repeater and a digi. Do you have access to it?

For anyone interested, we did some more testing this afternoon.

I sent KF4YMC 10 messages all using different PATHs. We learned that UI-View will send 2 acks for each message - each time it recives the message.

Roy, I don't know of any WIDEn-n or TNn-n digis in the area. Your choice is Relay, Wide, or TN. Yes, a new TNC that supports the n-n would be nice at several digi sites, but Santa Claus keeps leaving it out of my stocking. So we use what we have until it breaks. As for WA4KJH-7, think of it as N4QEA-7. It's a long story as to why it id's as WA4KJH-7. I'll leave it simply this way, Keith pays the electric bill at the site.

William,

Something else to consider as your looking at this site. A single element Folded Dipole at 3dbm will give better coverage than a 9 or 12 db collinear. The dipole looks down where the higher gain antennas look out at the horizon. In mountainous terrain you want down tilt in the antenna pattern, especially when trying to cover areas right underneath it.

558. RE: [EastTNAPRS] Changed digi path

Yahoo group: EastTNAPRS
Date: 2005-09-13 00:01:43 UTC
From: John Moyers
Topic: 547 Message: 558

Not a bad idea..... That was the reasoning for Relay. The lower stations would run RELAY so that the mobile's and HT could digi through them in order to get to a WIDE. The WIDEn-n came about in the high density areas to relieve some of the congestion. I think the closest high density usage area around here is still down towards Atlanta. East TN is still a small usage area, Memphis may be growing. However watching this email list I can see that APRS may finally be gaining some interest.

For the most part I'm inactive as far as actively monitoring anything. Years ago I ran a WX station on APRS and beaconed WX Data. How many in this area are still doing this? At that time WX4MRX monitored APRS for reports and the remote wx data. It helped them get some real time wx data to confirm what the radar was showing. So how many in this group uses APRS to UPLINK WX Spotter info?

If Santa were to bring you a replacment TNC which one would you choose?

Given the large area that WA4KJH-7 covers and the fact that I would be hearing virtually nothing without him, I'd be willing to chip in for some new equipment to go on the mountain.

On Mon, September 12, 2005 6:48 pm, John Moyers said:

560. RE: [EastTNAPRS] Changed digi path

Yahoo group: EastTNAPRS
Date: 2005-09-13 01:08:13 UTC
From: William McKeehan
Topic: 547 Message: 560

APRS has been used to send messages to WX4MRX during events. Although lately, I've not seen WX4MRX. I know at one point they were trying to use the WIDEn-N as their path - so I think their station is on the air, but not being digi'd by WA4KJH-7, so I (and most people in and around the Knoxville area) don't see it.

There are a few weather stations around:

K4CHT-2 in Hamblen County
K4RWH in Blount County
WO4U-10 in Cumberland County

I think there's another WX station in Knox county, but he's not currently on my map.

As for digi's that support WIDEn-N, most of the big near-by digis do support it now; there are only a few that do not.

Here's a list of nearby ones that do support WIDEn-N:
W4LAW-3 down near Cleveland, TN
KF4CFO-7 in McMinn County, TN
N4NEQ-3 in Graham County, NC
W4FX0-3 in Sullivan County, TN
KF4OWQ-2 in Laurel Couty, KY
NT4UX-2 in Cannon County, TN
N4HAP in Coffee County, TN
KE4CJA-4 in Transylvania, NC
W4HF-9 in Carroll County, VA
W4HF-2 in Willies County, NC
KD4BNQ-3 in Giles County, VA

WA4KJH-7 is the only one in a good radius that does not support the WIDEn-N. Just a few months ago, there were two other digi's near us - I think both in Eastern NC that were configured just like WA4KJH-7, but it looks like those have recently changed also.

Some of these that do support the WIDEn-N only support n-N and not the generic WIDE (or RELAY for that matter). This is a change that has been pushed by some areas like LA and DC but has been slowly pushing across the nation.

It would be interesting to see how many stations WA4KJH-7 hears that it does not digi because they are using WIDEn-N.

On Mon, September 12, 2005 8:01 pm, John Moyers said:

561. Re: Changed digi path

Yahoo group: EastTNAPRS
Date: 2005-09-13 02:00:40 UTC
From: ff943
Topic: 547 Message: 561

I (Kevin / KF4YMC) Ehco Williams' statement, If this is to be a
Nation Wide System, We all need to be on the same page.
And WX4MRX has shown up a time or two on my screen using Wide2-2.
and I was set up to digi WIDEn-N and did digi him out. It's just too
bad someone close to WX4MRX who get him direct most of the time can't
set up their digi as a Wide n-N to help get him out to us all.
And I know of a few who use APRS to report weather, but they use the
I-Net connection, to make darn sure the messages gets there.

I'd also be interested in pitching in for some equipment. I'd also like to provide some labor too the cause as well.

563. RE: [EastTNAPRS] Changed digi path

Yahoo group: EastTNAPRS
Date: 2005-09-13 02:17:00 UTC
From: David J. Hoffman
Topic: 547 Message: 563

I thought WA4LAW-3 is in Chattanooga on Signal Mountain?

David J. Hoffman - KE4FGW
message sent from my Palm

"William McKeehan" <mckeehan@...> wrote:

564. Re: Changed digi path

Yahoo group: EastTNAPRS
Date: 2005-09-13 02:20:33 UTC
From: ff943
Topic: 547 Message: 564

I wonder why no one critized me when I was running a WIDEn-N digi and
was putting the traffic into Knoxville area. Oh yea that's right they
can't hear me. Or was it they paid no attention to the path.
Which ever it was, dosen't really matter.
Roy is just two steps ahead of the crowd. and if you see me (KF4YMC)
on you screen, check my path, it is WIDE2-2. This gets me to
Knoxville, Chattanooga and I have been heard in Middle TN. Not that I
really care. Ive been heard in places that relay and wide don't get
anywhere. I know in due time WA4KJH-7 will be changed or replaced,
but as in all things, it takes time. and we are really fortunate to
have such a digi with such coverage area as KJH-7. Let me get off my
soap box... TNX...Kevin...KF4YMC

I would like to thank William and Roy for their assistance.
I also found out I was having a small putor problem. I am hoping re-
booting my system (with a size 12 boot) corrected the system problem
Again thank you William and Roy for you help...Kevin / KF4YMC

Did all 10 messages make it even though they had different paths? If not, what paths worked?

567. Area digipeaters

Yahoo group: EastTNAPRS
Date: 2005-09-13 02:52:20 UTC
From: WA4YYM@aol.com
Topic: 567 Message: 567

In a message dated 9/9/2005 9:31:06 AM Eastern Daylight Time,
EastTNAPRS@yahoogroups.com writes:

Now, you asked about what digi's are around and how they work - let's take a
quick look and see.

WA4KJH-7 - RELAY,WIDE,TRACE,TN
N4NEQ-3 - ?
KI4HDU-2 - Only responds to stations heard direct (regardless of path used)
KF4CFO-7 - RELAY,WIDE,WIDEn-N
W4LAW-3 - RELAY,WIDE,TRACE,TN

My home (fixed) digipeater alias is WA4YYM,RELAY,WIDE1-1

Topic: 547 Message: 568

My two cents.
On one of his recent trips through the Knoxville area, I had a chance to ask WB4APR what was his first choice of TNC for a new DIGI. His response, Kantronics KPC3+.

Jeff
KF4UVT

William McKeehan wrote:
If Santa were to bring you a replacment TNC which one would you choose?

Given the large area that WA4KJH-7 covers and the fact that I would be hearing virtually nothing without him, I'd be willing to chip in for some new equipment to go on the mountain.

You're path is set to WIDE2-2? I'm hearing your packets via WA4KJH-7 - nothing else in the path.

From: William McKeehan
Topic: 547 Message: 570

As long as I started the path with WA4KJH-7 (the only digi that I can hear/talk to), then the message made it to KF4YMC. But I was able to generate multiple packets that made it to KF4YMC by using other paths. Here's what was tested:

Test 1 - via WA4KJH-7
Test2 - via WA4KJH-7, WA4BDS
Test 3 - via WA4KJH-7,WIDE
Test 4 - via WA4KJH-7, WIDE2-1
Test 5 - via WA4KJH-7,WIDE2-2
Test 6 - via WA4RYW-1
Test 7 - via WA4KJH-7,WA4RYW-1
Test 8 - via WA4KJH-7,WA4BDS,WA4RYW-1
Test 9 - via WA4KJH-7,KF4CFO-7
Test 10 - via WA4KJH-7,WA4BDS, KF4CFO-7

Only Test#6 did not work.

571. RE: [EastTNAPRS] Changed digi path

Yahoo group: EastTNAPRS
Date: 2005-09-13 12:36:01 UTC
From: William McKeehan
Topic: 547 Message: 571

You are correct - I miss-looked at my map. It is over in Hamilton County on Signal Mountain.

On Mon, September 12, 2005 10:17 pm, David J. Hoffman said:

572. re: [EastTNAPRS] Re: What am I overlooking ?

Yahoo group: EastTNAPRS
Date: 2005-09-13 13:31:17 UTC
From: David Hoffman
Topic: 547 Message: 572

Seems to me you told WA4JKH-7 what to do.? You told all your packets to go through WA4KJH-7 which you hear direct, except in case #6, .? Of course this would work.? The digi did what you asked of it.? What I'm wondering is what if you used different aliases like the RELAY &?WIDE combinations there of without directing it straight at WA4KJH-7.? If that digi hears you direct, then let's see what it decides to pass on.? Isn't this the test you were trying?? This way you can see who else hears you and passes it on as well.? Am I missing the point here?
David Hoffman - KE4FGW

From: William McKeehan
Topic: 547 Message: 573

Well, in this particular case, we were testing multi-path, not testing to see how WA4KJH-7 would respond. The aliases that WA4KJH-7 responds to are well known: RELAY,WIDE,TRACE,TN; so testing any of those would have not really told us anything.

HOWEVER, if WA4BDS were to try the same thing, then using aliases would give different results as he hears more that the single digi that I hear.

The thing that we were seeing was KF4YMC sending multiple acks via different paths. We were able to duplicate the multiple acks by using a multi-hop path that would deliver the message to him multiple times (like WA4KJH-7,WA4BDS).

Does this clear things up a bit?

Wow, the time that you did hear it, you heard it direct. I agree - I'd like for them to use a path that would give them a better coverage - especially since they do send out bulletins during events.

William,
When we get together to work on Xastir, remind me to ask you about all
this path info. Since I have less than a month APRS experience,
I am still somewhat overwhelmed by it. I guess I am suffering from
Information Overload !

If they used a path of APRS,WA4KJH-7,WIDE2-2, would that not cover the area very well?

The WIDEn-n would make the second hop.

From: William McKeehan
Topic: 547 Message: 579

I think that would give them excellent coverage, a total of 3 hops - maybe covering too large of an area. But their area of influence is large. I would expect this path to cover all of East TN and even over almost to Nashville to the West, North into KY and VA, East into NC and south into GA.

It would certainly cover the large hole around Knoxcounty that their current path leaves.

Is anyone on the list seeing WX4MRX show up on your display on a regular basis? I wonder if they are getting out at all. I suspect that they are reaching some digi, but I do not know which one(s).

Yes, that path needs adjusting bad. I am very
surprised that it was setup like that. I have only
seen it a time or two here.

From: Ben Sager
Topic: 516 Message: 584

Moe, according to the old help file, if the msg is ack'd on a port, then UI-View remembers it and will use that port to get to that station in the future. Now that to me means, that if you can't ack a msg, try the other port and see what happens.

William, I had 2 msgs in response to your msgs that I could never get an ack from you on Sunday. I was using KJH-7 to get to you and it indicated that is how the msg came in to me.... Did you get 2 msgs from me??

Folks,

IMHO, regarding the WX bulletins distribution. I think that should be our number one problem to fix. It appears to be a simple fix of just changing their digi path. Is the station/pc a standalone that someone put in the NWSO or is it looked after daily by someone who knows what to do with it? We used to have a difficult time getting to our station at Sterling, VA NWSO and we had major problems with people "playing" with it on the night shifts that caused us headaches..

Also, how is WA4RYW-1 viewed as far as being a good helpful digi when compared to WA4KJH-7?? I have added it to my digi path trying to see the coverage.

When using Ui-View32 the Unproto address must start with APRS if you want
anyone to
hear you. The APU25N comes from a program substution using the first 2
letters of APRS.

Topic: 547 Message: 589

Well, you don't use UI-View, so it's confusing.

UI-View handles the path differently than other programs. If you look at your packets, you will see something in place of the APRS that is used for most UI-View stations. Looking at the most recent packet I've seen from you it is: GPSMV,WA4KJH-7*,WIDE

The GPSMV is automatically placed in there for you; same with most software. That is a "destination" address. UI-View requires it to be entered in with the Packet Path. In APRS+SA it's a seperate field on the setup screen - "Unproto To"

I hope this helps.

The first 3 of those are ack's to messages that I sent to WX4MRX yesterday I believe.

The last 2 are posits that have made it to an IGate and thus to the internet. Any idea how many days this log from findu.com covers?

I have sent a few messages to WX4MRX - it was a while back.

They recently made the change in their path. I THINK I was told that the path was changed by someone who "knows" what he's doing, but the operator just knows how to operate the station and does not understand path settings or how to change them.

Having said that, some others that are more involved with SkyWarn activities than I have had direct talks with the operator @ WX4MRX, so some of them may have further information.

It's my understanding that WA4RYW-1 is a low-level digi, operating primarily as an IGate. Does anyone hear him direct?

Well...WA4KJH-7 is only relaying him at certain times.

Look at the packet that you received earlier today - I'll bet you'll see KI4HDU-2 in the mix somewhere in that packet. I am setup to Gate any position or bulletins that he sends out - if they make it to the internet; I'll put them on RF with a path of WA4KJH-7, so you will see it. As for the 3 acks that you see below, those were from messages that I sent him - as we learned with KF4YMC, the acks will come back via they path they were received.

595. Re: [EastTNAPRS] WX4MRX

Yahoo group: EastTNAPRS
Date: 2005-09-13 19:29:21 UTC
From: David Hoffman
Topic: 547 Message: 595

I keep seeing the APU25N coming from all the UI-View stations, but still am unclear on how and why it shows up in the path.? See my station uses GPSMV VIA RELAY,WIDE.? I've alwways been confused on what the GPSMV part does.? I do know that if I change the last two characters, it will chnage my icon.? But how does this carry through all the digis etc.? I need a path/unproto lesson.
David Hoffman - KE4FGW

I believe it's default?is the last 24 hours worth.? You can change the URL to get more or less information if desired.
raw.cgi
This displays raw packets.
name
units
default
remarks
call
?
(mandatory)
?
start
hours
24
start of history
length
hours
start
length of history
time
?
0
if 1, prepends a timestamp to each packet
Example:
http://www.findu.com/cgi-bin/raw.cgi?call=k4hg&start=48&length=24&time=1

On my map, KJH-7 is under the IRLP symbol. I don't
remember how often I see him but I will checky..

I am copying RYW-1 occasionally too.

Sorry, I thought we were talking about KJH-7.. I only
see the WX4MRX off of KJH-7 and was wondering how it
was happening unless it was William doing it.

601. Re: [EastTNAPRS] WX4MRX

Yahoo group: EastTNAPRS
Date: 2005-09-13 20:00:51 UTC
From: William McKeehan
Topic: 547 Message: 601

Well...in "normal" packet operations, it will be a destination address. Since most APRS packets do not have a destination, this AX.25 field was taken for other purposes.

Specifically, it can contain 6 different types of information:
1 A generic APRS address
2 A generic APRS address with a symbol
3 An APRS Software and version number
4 Mic-E encoded data
5 A Maidenhead Grid Locator (obsolete)
6 An Alternate Net (ALTNET) address.

So the APU25N would fall into the 3rd category and would indicate some version of UI-View.

For my station, you will see APX161, indicating Xastir version 1.6.1

A Tiny Trak 3 will have something like APT310.

For the D700's operating without a PC attached you will see some strange text - that is Mic-E encoded data (for an example, look at a packet from KI4HDU-9 on FindU.com).

There's a lot more to this...but I'm at the edge of my knowledge. It's all covered in the APRS Protocol Reference (google for aprs101.pdf) starting on page 13 if you want to understand a bit more.

On Tue, September 13, 2005 3:29 pm, David Hoffman said:
>

From: Roy E. Pollard
Topic: 547 Message: 602

Do you see WX4MRX now?

Or Do you see MRX_OUTLK object?

Roy WA4BDS

Thanks William for this information and the time you spent on it.? I appreciate that.?
Looks like I've got some reading to do.? I've been trying to avoid that huge doc.? :-)

That is a huge doc - it helped me a lot in my initial understanding of APRS. It seems to assume that you have some understanding of packet - I did not, so everything in it was not clear to me. Then I started by capturing some packets off of RF and decoding them by hand using that document as a reference. Once I spent some time doing that, I began to understand it all.

I also subscribe to the TAPR aprs-sig where they talk about a lot of stuff; some of it over my head, but the longer I participate in that list, the more I understand.

As you read it and learn some stuff, be sure to share with us here; I'm sure there are things that I read in there that I did not understand, so another perspective will help me.

Which station did you send a message to?

KI4HDU-2 is my IGate and until recently did not respond.
KI4HDU-3 is my home station and it's often not on - and when it is on, it's only on via the internet.
KI4HDU-7 is where you would have to go to get my real station

Having said that...I do not remember getting any messages from you on Sunday. Was it during the net?

<snip>

This brings to mind discussion that has happened frequently on the aprs-sig;
the reliability of multi-hop communications.

Here's an excerpt from WB4APR's web site:
http://web.usna.navy.mil/~bruninga/APRS-docs/paths.txt

Although you are tempted to set a LONG path so everyone can
see you, remember that to them, you are just QRM. Especially since the
amount of QRM you generate grows geometrically with the number of hops
as shown in the following table. ALSO the probability of a successful
packet also goes down greatly. The following table shows the decreasing
probability of a successful packet if we assume a 50% probability of
collision and each WIDE can hit 4 other WIDES.

```
HOPS SUCCESS COPIES COMMENTS
---- ------- ------ -------------------------------------
1 50% 1 For local ops & special events
2 25% 5 Routine ops
3 12% 13 extended ops
4 6% 25 statewide ops Heavy QRM
5 3% 41 Nothing gets through. Too much QRM
6 1% 61 Useless AND totally boggs down network
```

PLEASE limit your hops to just your local region. APRS *IS* designed to
assure delivery to EVERYONE in a 1 or 2 hop area for REAL-TIME nets or
events. It was NOT designed for large extended area nets with thousands
on line... These days you CAN QSO great distances via the IGates, but
this is still a LOCAL process with only 1 hop to get to your IGate in
dense areas. As MORE people come to APRS, we must begin thinking
SMALLER areas...

I seen WX4MRX this morning before noon and it was
probably just right conditions. I normally see the
"outlook" several times a day up until around noon
time for some reason.

611. Re: [EastTNAPRS] WX4MRX

Yahoo group: EastTNAPRS
Date: 2005-09-13 22:49:00 UTC
From: David J. Hoffman
Topic: 547 Message: 611

I'm sure you can pick and choose which messages you want to read and use that delete button on everything else. I think it's a good idea Moe to get up there and change that path for them. It's obvious that what they are using now is working. As far as receiving unwanted messages, they realized that could happen when they set it up. I wouldn't direct everyone but key people to not send them a message. Message sending is just part of using an APRS station. I realized this on my own station and since I run my station most of the time without a laptop connected, my station simply ignores incoming messages. I still think training someone up there is a good idea. I wonder who the ham operator is that leaves that station accessable by non-ham operators?

614. Re: [EastTNAPRS] WX4MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 00:33:19 UTC
From: Roy E. Pollard
Topic: 547 Message: 614

We have a mix of old and new paradyme paths in our area, but the starting place
is WA4KJH-7. The next step would be to have the next digi to repeat
either the old
or the new to get to the distination.

Possible examples that might work with Ui-View32 are:

APRS,RELAY,WIDE2-2 3 hops only new after 1 hop
APRS,WA4KJH-7,WIDE2-2 3 Hops only new after 1 hop
APRS,RELAY,WIDE,WIDE2-1 3 Hops new & old after 1 hop
APRS,WA4KJH-7,WIDE2-1,WIDE 3 Hops new & old after 1 hop

This looks logical to me so there is probably something wrong with some of
them.

615. Re: [EastTNAPRS] WX4MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 00:39:00 UTC
From: David J. Hoffman
Topic: 547 Message: 615

My imediate guess is "what happens if WA4KJH-7 goes down?" Shouldn't we start the path off with APRS,RELAY or something on this order? Just wondering.

David J. Hoffman - KE4FGW
message sent from my Palm

From: Scotty McFadden
Topic: 547 Message: 619

Moe,
You think you're confused! I've only been on APRS about 3 weeks but I have it figured out. I went to Amazon.com and ordered a Greek to English Phrasebook ! (LOL)
Scotty

Subject: Re: [EastTNAPRS] WX4MRX

That is a good question... what happens with the power... battery back up or anything? I know I can work Kevin direct, can any one else hear me direct? It might be fun one night on the net to have a experiment to see who can hear who?... Something like chance the path away from WA4KJH-7 and see who hears who? Might be a fun idea... no messages just something like TX beacons out... Comments?

Moe

620. My two cents again on MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 00:58:13 UTC
From: ff943
Topic: 620 Message: 620

If we are trying to get wide coverage we need to know what setting the BIG DIGI's are using.
WA4KJH-7 R/W/T/TN
WA4LAW-3 R/W/T/TN
N4NEQ-3 in Graham County, NC ???
KF4OWQ-2 in Laurel Couty, KY
KE4CJA-4 in Transylvania, NC
W4HF-9 in Carroll County, VA
W4HF-2 in Willies County, NC
KD4BNQ-3 in Giles County, VA

I do not know which of these are the BIG DIGI's for the area, or even if they are in the MRX area. But what paths do they use, OLD or NEW or Both.
And just how far can MRX be heard reliably. Or dose some one do like William dose and grab it off the Inet and send it to their Digi.

For now a Relay, Wide to start would prob. Be better.

KF4YMC / KEVIN

621. Re: [EastTNAPRS] WX4MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 01:00:33 UTC
From: Roy E. Pollard
Topic: 547 Message: 621

That's easy send message to your direct
stations --- ?aprsd --- will return a list of that
stations direct heard list. Try different paths for that query

622. Re: [EastTNAPRS] WX4MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 07:59:33 UTC
From: Ben Sager
Topic: 547 Message: 622

Yes, I agree, I would go with APRS,RELAY,WIDE,WIDE2-1
or APRS, WIDE, WIDE2-1 to keep Bob happy.

Ben

From: William McKeehan
Topic: 547 Message: 623

Any idea who this guy is? Sounds like we need to get him involved in our discussion.

On Tue, September 13, 2005 4:51 pm, Moe Brewer said:

No path with RELAY or WIDE would make Bob happy!!!

I wouldnt do anything just yet. Plans are in place to update the local digi to the new settings, so no need to make 2 trips. Its hard enough to find time to change 1 setting for most folks, much less 2.

Topic: 547 Message: 625

Which local digi are you referring to?

Thanks

Roy

626. Re: [EastTNAPRS] My two cents again on MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 15:12:43 UTC
From: John Moyers
Topic: 620 Message: 626

Interesting..... about all of these.... If the SYSOP's just added WXMRX to their alias list then all the weather boys would have to do is beacon to WXMRX and it should propagate through the system.

Subject: [EastTNAPRS] My two cents again on MRX

If we are trying to get wide coverage we need to know what setting the
BIG DIGI's are using.
WA4KJH-7 R/W/T/TN
WA4LAW-3 R/W/T/TN
N4NEQ-3 in Graham County, NC ???
KF4OWQ-2 in Laurel Couty, KY
KE4CJA-4 in Transylvania, NC
W4HF-9 in Carroll County, VA
W4HF-2 in Willies County, NC
KD4BNQ-3 in Giles County, VA

I do not know which of these are the BIG DIGI's for the area, or even
if they are in the MRX area. But what paths do they use, OLD or NEW or
Both.
And just how far can MRX be heard reliably. Or dose some one do like
William dose and grab it off the Inet and send it to their Digi.

For now a Relay, Wide to start would prob. Be better.

David,

I've worked with Bruninga off and on with APRS for about 10 years. As for how RF in East TN works we have never agreed. He comes from flat lands and we live in mountains. Bob likes a one size fits all approach and RF doesn't conform to that. So I really don't care if anything makes Bob happy. I'm only concerned with making it work.

To be honest I haven't been that active in APRS since around 9/11/01 due changes in my work load the lack of users on APRS at that time. William has done well in getting this email reflector going. I can now see that activity has increased dramatically. I might even have to look at putting my antenna's back up at home. I lost them a couple of years ago in a storm and instead of getting them back up I was in West Tn putting up towers, antenna's, and repairing communications after some tornados. Have found the time to work on them since, my honey-do's keeping getting in the way....<G>

I sincerely hope that the interest and users continue to grow with APRS. Eventually some of you may be able to show APRS advantages during an exercise, or real event when your local EMA officals can appreciate what it offers. Right now the push is on voice comms, Computers and radio's are still a novelty..... Remember most people in Emergency Services think that Mobile Data started with them, not with Hams and Packet Radio 25 years ago.

Roy, the location won't change just the callsign. SSID will even stay the same. Unless I plug the wrong chip in..... I'm needing to go service the digi and a repeater that's in the building before winter gets here. So, I'll try to get all of this done at the same time. Just don't know when right now.

David,

The making Bob happy was just a sly remark about how Bob Bruniga hates RELAY and he is not crazy about lots of WIDE's either. But behind it all was a simple attempt by me of seeing something that could be a major problem *IF* WA4KJH-7 fails and letting you folks know it. NOT that you did not already know it! Anyhow, to compensate for that possible failure, one of the things you do is you put something in the MRX digi path that would allow other digi's, be they remote or certain homes stations, to takeover the forwarding until WA4KJH-7 is operational again. YES, there will be problems with collisions using WIDE (or whatever) "BUT" you would have service by the NWS. If you are trying to sell APRS as a good way to report problems/events and get alerts/warnings from the NWS, then you must have redundancy, even redundancy that might cause some problems until things are back to normal is better than nothing. I would think that if we worked our home digi's so that we have less digi-ing of WIDE for example, then we could get by with a working but somewhat crippled system. Of course, there is always using other routing schemes or using another fixed wide area service digi. A dedicated line to William from MRX is also a possiblity. I know that sitting this close to MRX and not having digital service from them and not being able to provide them with fast reports should not be happening. Even if we had just "warnings" is better than nothing. There are other ways to accomplish this (such as an additional freq) but this seems simpliest to *start* with and costs nothing other than Moe's time going to Morristown. I heard he works cheap too!! :))

Just trying to help guys, nothing more. This is longer than I wanted but it is hard to tell it short and get it understood.

John;

I was hoping that was what you were going to keep the repeater in that very good location.
Thank you for your support.

There is an effort underway to use APRS in our public service events like the MS150 ride
and others like it.

I agree with you too.? I was wondering why any station would want to specifically use a certain digi in their path unless to be very srict in what they were trying to do.? I speak as in the case of a mobile tracker.? I would want to use a path that would keep working even if one digi or relay point went down.? I like the idea of my packet getting out via multiple methods.? I do understand the need to cut down on duplicate paths from everyone though.? I can see that a little different method might be used for stationary stations etc.? I know William has discussed running his traffic through WA4KJH-7, but he does it not to relay everyone, but to keep down his duplicates and be more specific in who hears him.? I'm still reading and learning about all this path and unproto stuff.? So this is why I'm asking questions and trying to figure out what everyone is thinking.?

Thanks David, it is a starting point for at least some
discussion.. Plenty of people on here can answer
questions for you as they come up AND they will.. :))

639. Re: [EastTNAPRS] Re: WX4MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 17:26:32 UTC
From: William McKeehan
Topic: 547 Message: 639

In my non-mobile stations, I use specific digi's - WA4KJH-7 at my home QTH.

In my mobile configuration, I use RELAY,WIDE (or WIDE1-1,WIDE2-1 depending on where I am).

When sending messages, I use specific paths - based on how I hear the station that I am messaging or my knowledge of the network. For example, I wanted to send a message to W4EFG who I did not see on my map, I know he is in the area of KF4OWQ-2, and I know that KF4OWQ-2 can hear WA4KJH-7, so I used a path of WA4KJH-7,KF4OWQ-2 and got a message to his station.

Had I used something like RELAY,WIDE, my message would have been digid in areas that had no reason to hear it. It would have gone thru WA4KJH-7, then thru all IDE's that hear WA4KJH-7. Lots of needless packets. Using a specific path helps reduce the QRM.

On Wed, September 14, 2005 1:16 pm, David Hoffman said:

OK - so if these digi's all added the alias of WXMRX, what would WX4MRX use as a path? WXMRX or WXMRX,WXMRX ?

From: William McKeehan
Topic: 547 Message: 642

The only thing that I fear with WA4KJH-7 making the change to support WIDEn-N is how many packets from out of the area that it will bring in.

Bob's theory is that the 1200 baud 144.39 channel can only support an average user load of about 60 to 100 or so APRS stations or objects in an RF domain based on the typical transmission rates and number of digipeaters and number of hops. This is because any greater load than 100% channel capacity guarantees lost packets due to collisions.

See:
http://web.usna.navy.mil/~bruninga/aprs/ALOHAcir.txt
for more discussion.

I fear that the new and improved WA4KJH-7 will bring in more than the 100 stations once it supports WIDEn-N.

Should I be worried?

FYI: UI-ALOHA is a UI-View32 add-on that calculates the ALOHA circle of your APRS station.

It will bring in a lot of packets from out of the area. Why? Not because the digi is on the new settings (well, not ENTIRELY) but because you wont be killing yourselves with duplicates. Right now every station that can hit a home station and a digi using RELAY causes duplicates. Every WIDE you see come across your screen causes duplicates.

Down here in West TN when we switched the digi's to the new settings, the stations I seen on my map tripled, but the traffic went WAY down. There are lots of quiet periods now on 144.390 that I sometimes wonder if my radio is working.

It will be a good thing. We have seen this for ourselves and from watching the national aprs sig there are a lot of others reporting great things also.

644. WIDEn-N Comment

Yahoo group: EastTNAPRS
Date: 2005-09-14 18:23:40 UTC
From: ff943
Topic: 644 Message: 644

On a differant thread cause it's not MRX relayed.
My comment is at bottom..

Willian wrote:
The only thing that I fear with WA4KJH-7 making the change to support WIDEn-N
is how many packets from out of the area that it will bring in.

Bob's theory is that the 1200 baud 144.39 channel can only support an average
user load of about 60 to 100 or so APRS stations or objects in an RF domain
based on the typical transmission rates and number of digipeaters and number
of hops. This is because any greater load than 100% channel capacity
guarantees lost packets due to collisions.

I understand William on the outside traffic comming in. Here is three
samples (The WORST I could find) of something we may to deal with.
And I don't receive 1/1000 as good as KJH-7 dose.
And yes these are the three worst examples I could find, that's what
I was trying to find.

Check this path out: WX info every 15 minutes.
23:27:25R KD4QIA>APR846,W4LAW-3*,WIDE3*,WA4KJH-7*,WIDE,WIDE2-2 Port=1
<UI Len=47>:
=3432.00N/08431.00W-000/000/John's Homestation
That's one way to get it there.

And this one too:
23:29:10R KK4EB-15>GPSLK,W4LAW-3*,WIDE6-3 Port=1 <UI Len=68>:
$GPRMC,014026,A,3402.1143,N,08427.4198,W,0.000,0.0,130905,4.3,W*71
23:29:11R KK4EB-15>GPSLK,W4LAW-3*,WIDE6-2 Port=1 <UI Len=68>:
$GPRMC,014026,A,3402.1143,N,08427.4198,W,0.000,0.0,130905,4.3,W*71

And this one:
23:36:57R KF4ZLU-1>APR873,WB4GNA*,W4TL-3*,W4LAW-3*,WIDE3* Port=1 <UI
Len=39>:
=3345.06N\08613.04W>120/000/zlu mobile

FOR WHAT-IT-IS-WORTH . . . Kevin / KF4YMC ô¿ô¬

645. Re: [EastTNAPRS] My two cents again on MRX

I would think that you would want two to ensure that
it does cover the required Counties..

From: richdea2000
Topic: 644 Message: 646

Hey Kevin,

I understand what you mean about the abusive paths. The only thing that can be done is user education. If the digi that is local to KK4EB mobile was setup to the new settings, and dropped RELAY support, and also trapped out large paths (like wide6-6) then it wouldnt be such a problem. But, messages to this mobile user have gone unanswered. His path was even 'discussed' on the national aprs sig but still hasnt changed.

You can check out my APRS Traffic counter that runs 24/7 at my house here in Lexington, TN. I am halfway between Memphis and Nashville, and we currently have 1 digi down at the moment, but I still have over 200 unique stations so far. I usually see 300+ when all digi's are up and running. My station setup is just a J-pole on the corner of my house and I can usually see 2 digi's all the time, and at night 3 or 4 digi's at the most. But I only count unique packets, no duplicates are counted.

I also 'tag' abusive paths with over 12 packets seen with a different color, so its easy to see the users that paths should be modified.

The one that jumps out at me from East TN is WA4RYW-1. Although he isnt on the list today, I do normally see him using RELAY,WIDE4-4 which probably covers hundreds of miles.

Let me know if you find my site helpful. Its pretty easy to setup and I think William runs it up there also.

Later,
Richard

I have watched the APRS sig for a while and have heard the discussion about dups being generated by RELAY,WIDE paths, but I do not understand how that would happen. Can you elaborate?

For example, how does a path of WIDE compare to WIDE2-1 for number of dups?

On Wed, September 14, 2005 2:13 pm, richdea2000 said:

648. RE: [EastTNAPRS] My two cents again on MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 21:36:15 UTC
From: Alfred Keen
Topic: 620 Message: 648

Hello Everyone,
I'm new to the group and I subscribed a few months ago and have enjoyed reading posts from the group. This post is a possible answer to what kind of settings is on the KD4BNQ-3 Digi in Giles County Virginia. I'm the owner of the N4ZZQ-3 Digi in Tazewell County Virginia and when I changed the Digi to the new paths that Bob suggested. That Digi has stopped showing up on my APRS screen. I still get the same amount of APRS traffic as before just not as often per hour. I was curious if it went off the air and checked FINDU.com and it's still on the air. Then I changed my Digi back to the old settings just to see how well Bob's suggesting on the paths worked and the KD4BNQ-3 Digi was back and reliably seen in my area. Would this suggest that it set up with the old paths? I don't know for sure but I thought you would find this interesting. I set up my Digi back just as Bob had described on his website for Virginia / Maryland Digi's. Is anyone seeing my Digi N4ZZQ-3 or my truck N4ZZQ-14 in East TN and how often? I curious as to how the new paths are working. I hope everyone is doing well and 73's

Al Keen
N4ZZQ

I would think that you would want two to ensure that
it does cover the required Counties..

649. Re: WX4MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 22:06:38 UTC
From: richdea2000
Topic: 547 Message: 649

Hello William,

WIDE by iself would cause no duplicates. The problem arises when you have RELAY,WIDE or WIDE,WIDE (or longer) paths.

If 2 digi's (old setup) hear WIDE,WIDE then they both digi the first instance of WIDE. The problem arises when those 2 digi's hear each other and repeat the same packet again. Its kinda hard to explain but easy to see when looking at logs.

Old Settings:
hamuser>aprs,wide,wide
hamuser>aprs,digi1,wide
hamuser>aprs,digi2,wide
hamuser>aprs,digi1,digi2 <-- duplicate
hamuers>aprs,digi2,digi1 <-- duplicate

New Settings:
hamuser>aprs,wide2-2
hamuser>aprs,digi1,wide2-1
hamuser>aprs,digi2,wide2-1

And of course it is TONS worse with 3 hops, like RELAY,WIDE,WIDE

Hope this helps,
Richard

650. Re: My two cents again on MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 22:16:03 UTC
From: richdea2000
Topic: 620 Message: 650

You have a lot of unanswered questions on this one. How far is the digi that you could no longer see from your house? Is the BNQ-3 on the new or old settings? If you changed 1 digi to new settings, and another digi is on old settings, then the old digi is probably beaconing to RELAY or TRACE or WIDE which is no longer supported by the new digi settings. So even though it is still working and being seen by an Igate (as seen on findu.com), the beacon of the old digi isnt making it through the new digi.

Just like WA4KJH-7 beacons to WIDE,WIDE, even with a band opening, no new paradigm digi would retransmit its beacon, so nobody would see it except users near an old digi that happens to hear it.

Hope this makes sense,
Richard

651. RE: [EastTNAPRS] My two cents again on MRX

Yahoo group: EastTNAPRS
Date: 2005-09-14 22:53:16 UTC
From: John Moyers
Topic: 620 Message: 651

Well this is where I need to do a bunch of reading on some firmware. They could use COVE, WXMRX, WXMRX. Or depending on how the firmware is actually set up it could work similar to the SSn-n path. N4NEQ and I started the SS path years ago and then Bob added the n-n when the WideN started. In this case it would be WXMRXn-n. Of course I wonder if KJH-7 can be heard by all of the digi's in the MRX area? North Carolina might be in the shadows. Heard by all then COVE, WXMRX would work. Or would TN2-1, WXMRX work and possibly allow a bounce to the North Carolina stations since any digi in TN that can hear WX4MRX directly would catch the first bounce. Of course the old (current for KJH-7) system of Wide, WXMRX would work the easiest. This is an example of the old way possibly being better.

A little more history on WIDE. Originally only Stations that could cover a 50 miles radius minimum were supposed to be wide. If that standard had held the Saturation of WIDE, WIDE would not have become the problem that it is now. Primarily because there wouldn't have been a wide on every Mountain top.

OK - so if these digi's all added the alias of WXMRX, what would WX4MRX use as
a path? WXMRX or WXMRX,WXMRX ?

Roy, I accustomed to seeing an * on the station that was heard directly. In the Data you listed which one is the actual station heard? I'm going to take a SWAG and say that it's the last station listed. If this is correct, it appears that WX4MRX can only hear WA4KJH-7, NT4UX-2, and WA4BDS direct. Hm, if memory serves me correctly that is about how it was 5 years ago. Am I correct in the assumption that WA4BDS is home station close to the NWS QTH? If so then they are only hearing 2 wides direct. The purpose of using an alias of WXMRX was to limit their bulletins to just the digi's in their affected area. Another possible way based on this information would be to use WXMRX in only KJH-7 and NT4UX-2. Then set the path at WX4MRX to WXMRX, WIDE2-1 or WXMRX, WIDE. This would let the first jumps be from KJH-7 and NT4UX-2, then it would only digipeat one more time through the other digi's that can hear the first 2 direct. I suspect the dead zone would be in South West North Carolina. Of course that has always been their dead zone. Just some thoughts. John Moyers www.wohali.net -----Original Message----- From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On Behalf Of Roy E. Topic: 620 Message: 654

John; That is not a path but it is a list of all the stations that were heard directly by WX4MRX each time I checked. Some of the time there were two lines of stations Example -- 7:35AM All data was taken today from WX4MRX at the app times listed at the end of the lines. Ui_view32 has a feature that the stations heard directly may be displayed in a list. You are looking at the data that would be in that list. 73's Roy WA4BDS At 08:22 PM 9/14/2005 -0400, you wrote: >Roy, >I accustomed to seeing an * on the station that was heard directly. John:

I am 45 Miles from WX4MRX and surrounded by hills, Just like everyone else
down here in hill country.

73's

Sounds like some interesting ideas and it would require some testing get it
all figured out.

That makes sense - the WIDE actually has WIDE coverage. I don't think any such
recommendation exists today - if it does, it's not easily found.

WA4BDS is not located anywhere near WX4MRX. He is in south Blount Co.

Hm, if memory serves me correctly that is about how it was 5 years ago. Am I correct in the assumption that WA4BDS is home station close to the NWS QTH? If so then they are only hearing 2 wides direct.
>
> The purpose of using an alias of WXMRX was to limit their bulletins to just the digi's in their affected area. Another possible way based on this information would be to use WXMRX in only KJH-7 and NT4UX-2. Then set the path at WX4MRX to WXMRX, WIDE2-1 or WXMRX, WIDE. This would let the first jumps be from KJH-7 and NT4UX-2, then it would only digipeat one more time through the other digi's that can hear the first 2 direct. I suspect the dead zone would be in South West North Carolina. Of course that has always been their dead zone.

From: richdea2000
Topic: 659 Message: 661

Hello Don,

Your radio must be working as your passing packet to the internet from
this RV station 15 miles away:
WA4EWV>35BQ0P,WIDE2-2,qAO,WA4YYM:'q`?l# R/]"6+}
WA4EWV>35BQ0P,WIDE2-2,qAO,WA4YYM:'q`?l# R/]"61}
WA4EWV>35BQ0P,WIDE2-2,qAO,WA4YYM:'q`?l# R/]"62}headed towards CHA
WA4EWV>35BQ0P,WIDE2-2,qAO,WA4YYM:'q`?l# R/]"62}
WA4EWV>35BQ0P,WIDE2-2,qAO,WA4YYM:'q`?l# R/]"63}headed towards CHA
WA4EWV>35BQ0P,WIDE2-2,qAO,WA4YYM:'q`>l# R/]"6?}
WA4EWV>35BQ0P,WIDE2-2,qAO,WA4YYM:'q`?l# R/]"6.}headed towards CHA
WA4EWV>35BP9Y,WIDE2-2,qAO,WA4YYM:'q`>l# R/]"6>}
WA4EWV>35BP9Y,WIDE2-2,qAO,WA4YYM:'q`?l# R/]"60}headed towards CHA
WA4EWV>35BQ0P,WIDE2-2,qAO,WA4YYM:'q`>l# R/]"67}
WA4EWV>35BP9Y,WIDE2-2,qAO,WA4YYM:'q`>l# R/]"6*}headed towards CHA
WA4EWV>35BQ0P,WIDE2-2,qAO,WA4YYM:'q`?l# R/]"6+}

Double check your path as being APRS,WIDE2-2 no spaces or anything.
UIView requires perfection when typing in your path. A space between
the , and WIDE2-2 will result in a direct unproto path.

Hope this helps,
Richard

Another question for Don:

Are you sure the local digi W4LAW-3 supports WIDEn-n ?

This is the only WIDE area digi within 50 miles of you and it see's
your home station direct:

W4LAW-3>BEACON,TRACE,WIDE,WIDE,qAO,WA4YYM:!3512.55NN08516.65W#PHG5830/W-R-T-TN,
Signal Mtn.

But it is beaconing to some terrible paths. If its a KPC-3 its super
easy for it to be updated remotely (if it was setup like that in the
beginning).

The only other digi's are 2 RELAY only digi's around Chattanooga area.

From: William McKeehan
Topic: 620 Message: 663

I do not see KD4BNQ-3 on my map. Looking at Findu.com, it looks like KD4BNQ-3 is using a a path of WIDE,WIDE.

I'm assuming that
1) you do not hear KD4BNQ-3 direct
2) you do hear N4ZZQ-3 direct
3) N4ZZQ-3 hears KD4BNQ-3 direct

If that is the case, then N4ZZQ-3 would need to support the alias of WIDE to digi packets from KD4BNQ-3.

The only digi in VA that I see is K4ITV-3.

Hey Guys,
I want to do an APRS demo to Civil Air Patrol here in KY. I plan on putting an Open Tracker
in an airplane for my demo. So I don't have the entire APRS community trying to shoot me down,
any suggestions on setting up my Tracker?

richdea2000 <kb4ytm@...> wrote:
Hey Kevin,

I understand what you mean about the abusive paths. The only thing that can be done is user education. If the digi that is local to KK4EB mobile was setup to the new settings, and dropped RELAY support, and also trapped out large paths (like wide6-6) then it wouldnt be such a problem. But, messages to this mobile user have gone unanswered. His path was even 'discussed' on the national aprs sig but still hasnt changed.

You can check out my APRS Traffic counter that runs 24/7 at my house here in Lexington, TN. I am halfway between Memphis and Nashville, and we currently have 1 digi down at the moment, but I still have over 200 unique stations so far. I usually see 300+ when all digi's are up and running. My station setup is just a J-pole on the corner of my house and I can usually see 2 digi's all the time, and at night 3 or 4 digi's at the most. But I only count unique packets, no duplicates are counted.

I also 'tag' abusive paths with over 12 packets seen with a different color, so its easy to see the users that paths should be modified.

The one that jumps out at me from East TN is WA4RYW-1. Although he isnt on the list today, I do normally see him using RELAY,WIDE4-4 which probably covers hundreds of miles.

Let me know if you find my site helpful. Its pretty easy to setup and I think William runs it up there also.

Later,
Richard

I assume you are asking about what path to use and the frequency of the transmissions.

As for the path - consider using no path at all. The station would only be seen by those that hear it direct, but given the altitude, that should be a lot of stations.

For frequency of transmissions - I would say every 2 mins or so would be sufficient...unless the time for the flight is going to be short (<15 mins or so), then I would increase the rate, but probably no higher than ever 30 seconds.

I imagine that other people will have some suggestions.

Also note that the CAP group down here is (I think) planning to work with the UT Amateur Radio Club on their next balloon launch. The balloon will have an APRS tracker as well as other things. So you may want to talk with some of them.

That makes sense - the WIDE actually has WIDE coverage. I don't think any
such
recommendation exists today - if it does, it's not easily found.

669. History of Digi's in E. TN was My two cents again on MRX

Yahoo group: EastTNAPRS
Date: 2005-09-16 13:03:59 UTC
From: John Moyers
Topic: 620 Message: 669

Since I goofed that last reply up, let's try this way.

William, somehow the fact that the reference is hard to find doesn't surprise me. After doing a little more reflection I think a 35 mile radius was one of the other minimums, and Bob pushed the 35 mile minimum because he didn't have a site that would work further than that. Considering that Bob lived in Maryland, and I think he grew-up in Alabama, we always figured that he didn't have a concept of RF coverage in mountainous terrain. So the cookie cutter concept of 35 miles for a wide took a foothold since about anyone on a hill with a 100 foot tower could be a wide and cover the minimum range. With this cookie cutter coverage plan, California had WIDE digi's on every ridge and Mountain around. As the software took hold the crashes and congestion increased. From that came the current WIDEn-n configuration. But even that concept didn't take hold until Kantronics created the code in their TNC's to enable it. The Only Problem? You had to buy a new TNC. Pretty simple until you look at the $$$$ already invested in TNC's that are running perfectly and you have several of them because you used to put up NODEs for the packet BBS backbone and system. So why spend more $$$$ on a new TNC that fixes a problem that isn't in your area? Then about the time I lost the antenna's here at the house, we only had about 3 or 4 APRS users in East TN.

For several years back around 1996 I ran KJH-7 where it is now, and N4QEA-2 was located down in the Ocoee River area. We were trying to cover the river for the Olympics, but only had my tracker at the time so it wasn't of much use. However the N4QEA-2 did have coverage almost to Atlanta depending on where you were down there and coverage on I-75 from the Oneida exit down past Atlanta was almost solid. We had 3 digi's in Tennessee that covered I-75. Then due to a change in the repeater site down along the Ocoee, N4QEA-2 was relocated to Crossville until it had to come down to make room for some other equipment.

Of course back then we were up in the 145 MHz part of the band and the GE commercial radio's that I use worked fine. The commercial rigs are the only ones I have found that can take the abuse and rigors of working reliably in mountain top installation. Until I started using them, I had growing pile to fried 2-m ham xcver's that had given up the ghost while being used. So the GE Master II's and Exec II's have worked great. That is until BOB convinced the rest of the group, on a national basis, that APRS needed to move to it's current frequency. The problem is that my old die hard radios have receivers that don't work that far down the band very well. KJH-7 Probably works the best. The Master II that I used a Crossville has a Preselector Filter that refuses to efficiently tune that low and for mechanical reasons can not be forced. Which means that N4QEA-2 was hard-of-hearing. I have thought about replacing replacing the radio's, but I have yet to find a radio designed to work in this part of the band that I

think can hold up to the rigors of a mountain top radio. They have to deal with nearby lightening strikes, Wide shifts in temperature, MICE, Snakes, and bad tempered radio techs that have made to many trips to the site in waist deep snow trying to repair ghosts.....<G>

So hopefully that brings some of you up to speed on how APRS has gone in East TN. I'm glad to see it finally gather some steam. I might even have to look into to putting my tracker back into my work vehicle. Heck what's one more radio, I already listen to 6..... I think Richard KB4YTM can attest to some of this, although I don't remember when he started playing with APRS. Back then he and I worked together on in different ends of the state.

Y'all have fun

670. Comments on WX4MRX

Yahoo group: EastTNAPRS
Date: 2005-09-16 18:43:56 UTC
From: Scott
Topic: 670 Message: 670

Guys, it has been a while since I came to the group. Since the MS Bike ride, we had the hurricane right after, and I have devoted time to handling traffic on HF for it. And now I have been preparing for Cecil Ritcie's (WZ4V) funeral, sine I am preaching it tomorrow. But I did want to toss a couple of thoughts about WX4MRX.

(1) Remember, even though APRS could be a good tool, the ham operators there at MRX usually only number 2 operators when it is activated, and between them they may be trying to monitor up to 6-8 repeaters. So APRS may not be a big priority.

(2) The actual WX messages (such as the outlook, shapes, warnings, etc.) don't come through the actual WX4MRX APRS station. They go through a connection from the WX weather service servers. (I don't understand how all that is done legally or is even set up, but I am glad the FCC lets it happen.) Basically, all the actual RF WX4MRX APRS station does is send out a beacon.

(3) As I said, it could be a good tool, and I believe when Rocky Beckner, K8DRB ex WD8SBO, the former Skywarn Amateur Radio Coordinator set APRS up, that is what he intended. So maybe with time, it can evolve. But, since APRS messaging is not an exact science, and a "one shot, one try" message protocol, voice will have to prevail, so that we can help keep the public safe, which is what Skywarn is all about.

All that said, I think a great use for APRS with MRX would be for us to be able to send out "objects" detailing severe weather events, such as tornado touchdowns, hail areas, flood areas, etc. so the operators could know for sure the place we were reporting. But these would need to be used with EXTREME discipline as to not flood the screen with useless junk.

Just my take. Hope the path can be improved.

Scott NA4IT
District 3 Skywarn Representative, McMinn, Meigs, Monroe & Rhea Counties.

FOR WHAT-IT-IS-WORTH . . . Kevin / KF4YMC ô¿ô¬

Hello Everyone,
I'm new to the group and I subscribed a few months ago and have enjoyed reading posts from the group. This post is a possible answer to what kind of settings is on the KD4BNQ-3 Digi in Giles County Virginia. I'm the owner of the N4ZZQ-3 Digi in Tazewell County Virginia and when I changed the Digi to the new paths that Bob suggested. That Digi has stopped showing up on my APRS screen. I still get the same amount of APRS traffic as before just not as often per hour. I was curious if it went off the air and checked FINDU.com and it's still on the air. Then I changed my Digi back to the old settings just to see how well Bob's suggesting on the paths worked and the KD4BNQ-3 Digi was back and reliably seen in my area. Would this suggest that it set up with the old paths? I don't know for sure but I thought you would find this interesting. I set up my Digi back just as Bob had described on his website for Virginia / Maryland Digi's. Is anyone seeing my Digi N4ZZQ-3 or my truck N4ZZQ-14 in East TN and how often? I curious as to how the new paths are working. I hope everyone is doing well and 73's

Topic: 670 Message: 672

Scott, You are correct about the number of operators normally there. When Rocky first set the APRS up there is was mostly to monitor weather stations. APRS automatically collects the data from computerized weather stations at the house and then uplinks the data to the network. As FAR and the NWS is concerned this is probably the best use of APRS. It gives them a graphical read of telemetry to verify their interpretation of the radar.

I have seen a flash flood warning issued based on the rain gauge readings being sent out from an APRS station. It makes the warning easy when they can see in a particular area they are getting a significant and measurable amount of rain. Not to mention that in a 15 minute period they saw close to an inch of rain register on the gauge.

The other use for APRS is something that was being done in Florida, They were pulling warnings off of EMWIN, which is text based, and rebroadcasting them. The way the software worked is that they to color a county based on the type of warning issued. This is useful information in an EOC, shelter, and during operations by field personnel. I'm currently using Weather Message to give me the same information at the house.

As for up linking objects that have been observed. It can be useful, the big draw backs are not only the number of objects that can be beaconed, but also the accuracy on the location of the object. The location shouldn't be as big of a problem now provided the maps used show good detail and are accurate themselves.

680. Fwd: WCARS VE test session for October 2005

Yahoo group: EastTNAPRS
Date: 2005-09-17 22:27:30 UTC
From: William McKeehan
Topic: 680 Message: 680

I was asked to pass this along to the group...

```
------------------------------ Original Message ------------------------------
Subject: WCARS VE test session for October 2005
From: "Willard H Sitton" <willardsitton@...>
Date: Sat, September 17, 2005 11:49 am
To: mckeehan@...
--------------------------------------------------------------------------------
```

The Oak Ridge Hamfest is the third Saturday in October. This is WCARS normal testing date, so WCARS will NOT test in October. We try not to conflict with hamfests.

Please put a notice about this on the Yahoo group site.

Thanks,

Willard

But, if you want to test in October, the Smoky Mountain Amateur Radio Club will have their regularly scheduled VE testing on October 10th. This is a WCARS session.

This session is on the second Monday night of every even-numbered month at 7 p.m. The location has changed in recent months to the St Andrews Church parish house, which is located on Montvale Road, across from the new Maryville Municipal Building. (Approximately N35 45.15, W83 58.45) Testing is in the library on the main floor of the parish house. If no parking is available at the church, parking is allowed across the street in the parking lot behind the new fire station.

For further information on the VE session contact Carroll Peabody, W4PCA, at w4pca@....

From: William McKeehan
Topic: 682 Message: 682

FYI - this looks like the meeting to attend if you are interested in participating in the tracking and recovery team for the UX-3 flight.

---------- Original Message ----------
Subject: UX-3 Track and Recovery UX-3 Balloon Track and Recovery Meeting From: "David J. Hoffman" <ke4fgw@...>
Date: Tue, September 20, 2005 7:26 am
To: chat@...

It's time to get everybody together for a UX-3 Track and Recovery Meeting. We would like to see who all is interested and what equipment everyone has got for tracking and recovery purposes. It would be great to answer any questions that may go along with chasing and tracking the UX-3 payload throughout it's travels to near space. We plan on having several different transmitters on board this mission, all of which we can use to follow it's flight path. You can bring along your APRS tracking stations, DF tracking equipment and whatever equipment you feel would be helpful in tracking this mission. We can discuss the many ways on how to track and use any or all of the available transmitters on board. The meeting date is planned for this Saturday, September 24, at 11 AM at the Sevier Heights Baptist Church on Hwy 129. Talk-in can be coordinated on the 146.94 machine that morning. All are welcome to come and participate, even if you aren't planning to help recovery this pay
load.

683. How Useful is APRS

Yahoo group: EastTNAPRS
Date: 2005-09-22 20:50:11 UTC
From: William McKeehan
Topic: 683 Message: 683

I've been doing some thinking this week about the usefullness of APRS.

In my opinion, using APRS for an event can be very beneficial. It would help manage the location of assets during the event.

I can even see it being useful during SkyWarn events to keep track of the weather spotters and to have a very good idea of where they are when they report something important.

Other than that, on a day-to-day operational basis, is APRS valuable?

I'm looking for thoughts and ideas.

Well William, Thats a pretty good question for the group. I think that on a daily basis it is useful as I use it for Weather Information, and have it up in case the NWS needs some data from the local area, however some may have different opinions about that. In as much, if they do???, advise me and I'll shut down my WX Station to keep from cluttering up the APRS Network, (since it is very busy here in Maryville.)

William McKeehan <mckeehan@...> wrote:
I've been doing some thinking this week about the usefullness of APRS.

In my opinion, using APRS for an event can be very beneficial. It
would help manage the location of assets during the event.

I can even see it being useful during SkyWarn events to keep track of
the weather spotters and to have a very good idea of where they are
when they report something important.

Other than that, on a day-to-day operational basis, is APRS valuable?

I'm looking for thoughts and ideas.

Busy? No way. Your weather station fits right in the network with out any problems. The more everybody knows about it, the useful it will become to everyone. Thanks for having one on the air.

I started in digital (hf/vhf packet) in 1986+- and the biggest thing I had to learn with APRS was that for the most part APRS just sits there quietly running and displaying what it hears. It doesn't require much, if any, maintenance or attention.. Which is good.. I learned it was kinda like watching paint dry with it but it can provide a service when needed. Such as the Skywarn information but with voice people not wanting to give up their thing, it is hard to give APRS a job to do! So it is just sitting there running quietly and waiting for something else to do. It will happen, sometime. Mine is displaying Rita data at the moment.

Good question William, and Rod keep the wx station up and running. Personally I would love to see a full time WX station active in every county. WX affects every aspect of any disaster and MET Data as a graphical view is very useful. In some instances I can see the need for many WX stations spread out across a single county. To give you an idea on how important this data is, many hazmat responders carry pocket wind velocity gauges. Every EOC has a card board compass on the wall so they can show wind speed and direction. This met data is updated every 15 minutes to 1 hour depending on the need. If you want to know how useful this type of data would be, the next time you talk to your local EMA director ask him this. Would you be interested in a technology that could give you Real Time WX data presented on a map and show the data of the surrounding counties as well as that within your county? Then be prepared to deliver the info in a demonstration. The real beauty is all they need in the EOC, as a minimum, is a receiver and someone that knows how to use the software..... One of the neatest things that APRS-DOS used to do was to show wind direction trends across a region provided you had enough WX Stations reporting.

From: William McKeehan
Topic: 683 Message: 688

I have to agree with John on this one.

I don't know much about watching weather. I assumed that the hi-tech gear that the NWS has is more than enough to tell them what is happening with the weather. In asking about weather stations on another sig, I learned that the weather stations give very valuable data to the NWS. I suggested that a weather station was not needed at my QTH - I was quickly told how wrong I was! They would like to see a lot more weather stations - like John says, in every county or even closer.

Some weather stations provide their data via the internet only (see: http://www.wxqa.com/)
While this works most of the time, having a weather station on RF gives a bit more reliability - i.e., it does not depend on the internet being up.

If anyone has any leads on inexpensive weather stations (maybe even a build-it-yourself kit thing), let me know. It is on my list to add a WX to my station...maybe it should be on everyones list.

After posting my question, I began to think about it myself.

I think that An APRS station is like any other HAM station. During normal times, the station needs to be exercised so you are prepared to use the station when called upon without wasting time trying to learn how to use the equipment.

So I guess that normal every-day operations of an APRS station is just like normal every-day operations of any HAM station.

Thanks to everyone that took time to respond to my question...

I am waiting on Davis to send my temp/humidty module back and I will have by Vantage Pro on the air. It was showing either 0% or 100% humidty only.. Nothing else!! They (davis) say the big storms have brought them lots of repair business. Mine will only be on the internet side since we have a station 6.5 miles away from me. I have provided data to the NWS and wunderground in the past with it and it worked very well. It also shows up on the internet side of APRS.

691. Re: [EastTNAPRS] How Useful is APRS

Yahoo group: EastTNAPRS
Date: 2005-09-23 12:54:14 UTC
From: Ben Sager
Topic: 683 Message: 691

Yes, that is what we found with VDEN. That was a main
reason we forwarded ordinary bulletins because it
exercised the system and showed any possible network
problems fast. Which is why I asked about the wx
bulletins being forwarded down here.

692. APRS WX Stations

Yahoo group: EastTNAPRS
Date: 2005-09-23 12:54:45 UTC
From: William McKeehan
Topic: 683 Message: 692

I know several of us only monitor activity on RF and do not monitor the internet side of APRS. Given that we are no where near saturated with stations in the area, I would suggest that you put the WX info on RF if it's not too much trouble for you.

Are you happy with the Vantage Pro? Would you recommend it for someone setting up a new weather station?

I would highly recommend the Davis brands, however, some models are not cheap. I searched the internet and bought my Vantage Pro from a store in NJ for $200.00 less than what it was normally being sold at. Davis just discontinued the Vantage Pro and now have the Vantage Pro 2, so you may find the Vantage Pro on sale.. I will try to find the invoice on the store and give you their link. I've used 2 other Davis stations that costed less that performed very well too. ambientweather.com is a good site with info and equipment. My wife and I have always been weather buffs, so it was easy to convince her that we needed a weather station.. :)))

FWIW, I started with the Davis Weatherlink program which works well and is rather simplistic to set up. I then went on to the Virtual Weather station software which offered anything and everything but I could never get it to work right. After more research I settled on a happy compromise which is Weather Display that works great! I use Weather1 and Weatherexchange on the pc to monitor other locations.

694. [Fwd: APRS / Tracking Meeting this saturday]

Yahoo group: EastTNAPRS
Date: 2005-09-23 13:59:26 UTC
From: William McKeehan
Topic: 694 Message: 694

For anyone interested in the Balloon launch/tracking.

---------- Original Message ----------
Subject: APRS / Tracking Meeting this saturday
From: "Daniel Bowen" <dbowen1@...>
Date: Fri, September 23, 2005 9:53 am
To: "UTARC Chat" <chat@...>

Hello everyone,
Just a reminder, there will be Tracking Setup meeting tomorrow
at 11am, Saturday September 24, hosted by David Hoffman. Topics will
include the mobile/portable configuration of APRS, Packet Radio, 2m, 440,
and Direction Finding. This is primarily to get the UX-3
tracking team's mobile gear set up and functional, however anyone is welcome
to come and participate.
Please pass this on to anyone else you know wishing to join in the tracking
effort.

Time: 11am-3pm
Location: Sevier Heights Baptist Church, at 3232 Alcoa Hwy Knoxville, TN 37920
http://maps.google.com/maps?q=3232+Alcoa+Hwy,+37920&spn=.
136583,.194063&hl=en

UX-3 Launch is proceeding on schedule for October 22 from the UT Knoxville
campus. more volunteers are still needed for the launch teams!

Thanks,
Dan Bowen

695. Building Trackers ?

Yahoo group: EastTNAPRS
Date: 2005-09-24 03:36:10 UTC
From: William McKeehan
Topic: 695 Message: 695

I have been doing some looking around at how other people have built trackers.
I was recently given a link to this web site:

http://www.kd7lmo.net/picobeacon.html

It's very light weight (5.9 oz) complete tracker (minus the antenna).

Subject: [EastTNAPRS] PIC-Based TNC

Hi all,

I was talking to Jeff, KF4UVT about TNC's and such and he happened across this page. I am thinking about ordering one of these and building it for the balloon launch to help with tracking. I was wondering if anyone knows anything about these or see anything blayentaly wrong that it will not work.

I am looking a t buying the main assembly, the GPS add on board and the case. From the description they give this should be a breeze to assemble. Anyone else interested in this?

701. Tracker Parts List

Yahoo group: EastTNAPRS
Date: 2005-09-26 02:24:21 UTC
From: Travis J. Maclay
Topic: 701 Message: 701

If anyone is interested and needs a few parts for the balloon project, let me know. Here is a partial list of things I have in the shack that are very useful for tracking. These are the things that come to mind after hearing much talk on purchasing TNC's, etc for the balloon project. I have used most of these in FL where our ARES organization was VERY involved in APRS & tracking for public events.

(1) AEA PK-12 TNC
(2-3) TinyTrak II
(2-3) GPS Engine (NMEA output)
(2) GPS Mag-mount antenna
(2-3) 2m HT's
(1) PIC interface
(2) Pentium 1 laptop (Win98)

Possibly other things as needed, such as mobile radios, KPC-3+'s, Mac PowerBook, etc.

Let me know if something is needed for a particular project we are trying to get ready.

Topic: 699 Message: 702

Hello Moe,

I have one of these TNC's are they are the best. I replaced my Igate TNC that was a MFJ1270 with the tnc-x, and I must say it decodes much much better than before.

Your right, it is a breeze to assemble but does take soldering and correct parts placement but just be careful and you wont have any problems.

As far as using it as a balloon tracker, I dont know what it would do at those altitudes. I hear lots of folks use the Opentracker (that I use for my mobile station KB4YTM-14). Here is a link to Scott's website: http://n1vg.net/opentracker/

This kit was also a breeze to assemble and works well. Scott also sells a small GPS that interfaces with the Opentracker for like 65 bucks or so. Its very small as I have it sitting inside my rear windows using velcro and it doesnt move at all. It has a magnet inside if you wanted to stick it to something metal. I hope to buy a 1-wire weather station soon and I will probably buy another Opentracker kit and make that my home aprs wx station setup.

Hope this helps a little,
Richard
KB4YTM

1-wire wx station for less than 100 dollars

703. Two Federal Agencies that met their challenges and work with amateur radio!!

From: Ben Sager
Topic: 703 Message: 703

washingtonpost.com
As Storms Threatened, Weather Service and Hurricane Center Stepped Up

By Stephen Barr
Monday, September 26, 2005; B02

At a moment when confidence in the government's ability to handle big emergencies seems to be sinking, it's important to remember that two vital agencies -- the National Weather Service and the National Hurricane Center -- met the challenges of Katrina and Rita.

Rep. Thomas M. Davis III (R-Va.), chairman of the House Government Reform Committee, last week held the first of several hearings on the government's bungled response to Katrina. The Weather Service and the Hurricane Center, he said, "passed Katrina's test with flying colors."

Earlier, Sen. Jim DeMint (R-S.C.), chairman of a Senate commerce subcommittee on disaster prevention and prediction, said the Weather Service, in tracking Katrina, produced "one of the most accurate hurricane predictions we have ever seen."

Davis and DeMint pointed out that countless lives were saved because of the early and accurate warnings that flowed from the Hurricane Center as Katrina marched across the Gulf of Mexico in late August.

Rep. Nancy Pelosi (Calif.), the House Democratic leader, praised the Weather Service last week for "probably . . . the best performance of any of the federal agencies in all of this."

The Weather Service and Hurricane Center also are two agencies that know how to communicate effectively with the public. The Weather Service posts regular bulletins that help shape news media reports. Max Mayfield , director of the Hurricane Center, never appeared too tired to explain Katrina in televised interviews during the last week of August.

In his prepared testimony before the Davis committee, Mayfield said the Hurricane Center participated in 471 television and radio interviews from Aug. 25 through Katrina's landfall in Mississippi on Aug. 29.

On average, Mayfield said, forecasts of where Katrina would go "were more accurate than usual" and exceeded federal performance goals set for hurricane forecasts this year.

Davis said the forecasts showed "remarkable accuracy." Storm-track projections provided to the public 56 hours before Katrina came ashore were off by only 15 miles, he said. The Hurricane Center's predicted wind strength for Katrina at landfall, two days before the storm hit, was off by only 10 miles per hour, Davis said.

Mayfield personally called state and local leaders two days ahead of time to warn them about Katrina and gave daily pre-storm briefings to officials at the Department of Homeland Security, Davis said.

But government at all levels fell short in responding to the disaster, Davis said. "Over the next few months, we'll try to figure out why," he said.

One agency that was in place and ready to respond was the U.S. Coast Guard. In the greater New Orleans area, the Coast Guard reports it saved 33,520 lives through air and water rescues.

Coast Guard Adm. Thad Allen was called upon to take charge of the Katrina response and recovery activities in Louisiana, Mississippi and Alabama, and Coast Guard Rear Adm. Larry Hereth is coordinating the Rita response in Texas.

Katrina Tax Break

President Bush has signed legislation to provide tax breaks for Hurricane Katrina victims, including a provision that would waive penalties for people who need to withdraw money from their retirement accounts.

The provision would cover the Thrift Savings Plan as well as 401(k) plans, a TSP spokesman said. The TSP has about 3.5 million participants and provides retirement savings accounts to civil service, postal and military personnel.

The legislation, signed Friday, would allow eligible individuals to withdraw a maximum of $100,000 from their retirement accounts without paying the usual 10

percent tax and would increase the limit on loans from pension plans from $50,000 to $100,000.

Hurricane victims applying for the tax waiver would pay income tax on the withdrawal over three years but could avoid the tax by making a repayment within three years.

An estimated 92,000 federal employees worked in the Gulf Coast states hit by Katrina last month, according to a preliminary tally by federal officials.

706. SEDCO ticket

Yahoo group: EastTNAPRS
Date: 2005-09-28 14:52:40 UTC
From: David Hoffman
Topic: 706 Message: 706

I have a SEDCO ticket if somebody is needing one.? This is for the SouthEastern DX and Contesting Organization Convention on Oct. 1, 2005 at the Mainstay Suites in Pigeon Forge, TN.? The price is right.
Also on Saturday, October 1 - after the Ten-Tec Hamfest, the fun continues into the evening with the SEDCO DX and Contest Conference, to be held at Mainstay Suites in Pigeon Forge, TN. This event is separate from the Ten-Tec hamfest and is sponsored and organized by SEDCO (Southeastern DXers and Contesters) and is being run as a NON-PROFIT event by W4NL, KA4S, and W4UWC. Ten-Tec and DX Publishing - publishers of DX Magazine - are providing support and endorsing the event.
For more information, check out http://radio.tentec.com/Hamfest
Exact schedule of presentations to be determined - see the SEDCO website www.sedco.homestead.com (http://www.sedco.homestead.com)
Just reply to this email if you are interested.

To: "TAPR APRS Mailing List" <aprssig@...>

A new APRS symbol for "Farm Tractor" (or other farm machinery) has been officially assigned to the position "F" in the APRS primary symbol table.

To encode this symbol with a TinyTrack, TH-D7, D700 or other hardware device set your symbol code to " /F ".

I have updated the symbol sets for UIview, UIpoint and APRSplus on my website to include a tractor in John Deere green with yellow wheels.

Download the latest "Rev H" symbol sets at:

712. New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-01 02:16:17 UTC
From: Travis J. Maclay
Topic: 712 Message: 712

I have finally setup the KPC-3+ as a digi just 4 miles south of downtown Knoxville. The digi is on Alcoa Hwy (129) between the intersections of Maloney Road & Power Drive, at Sevier Heights Baptist Church. Antenna is at approximately 50' above Alcoa Hwy. Power is 35 watts into a 6dB gain omni antenna.

The real question now...my digi settings. I have included a list below of how it is programmed. I followed as best I could Bob Bruninga's recommendations. Do you guys see any concerns or problems with these settings? Fire away.

One thing I have noticed is that the digi, although it seems to be working, is not being picked up & reported to any IGates. I am assuming this is because of an unproto of APN383. This was Bob's recommendations, as it "keeps it local", however, even on Findu, I can see other digis being picked up with similar setups as mine. Any thoughts there?

73,
Travis N4TJM

Reminder from the Calendar of EastTNAPRS
http://groups.yahoo.com/group/EastTNAPRS/cal

SEDCO DX and Contest Conference
Saturday October 1, 2005
All Day
(This event does not repeat.)

Notes:
Saturday, October 1 - after the Ten-Tec Hamfest, the fun continues into the evening with the SEDCO DX and Contest Conference, to be held at Mainstay Suites in Pigeon Forge, TN. This event is separate from the Ten-Tec hamfest and is sponsored and organized by SEDCO (Southeastern DXers and Contesters) and is being run as a NON-PROFIT event by W4NL, KA4S, and W4UWC. Ten-Tec and DX Publishing - publishers of DX Magazine - are providing support and endorsing the event.

See: http://radio.tentec.com/Hamfest for more information

715. Re: [EastTNAPRS] New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-01 03:46:39 UTC
From: William McKeehan
Topic: 712 Message: 715

The only problem that I see right off is the path.

I suspect that you have followed Bob's suggestions for everything - which would be a great thing IF our digi's supported the new WIDEn-N paradigm.

I would recommend that you change the two lines:
3 APN383 VIA WIDE2-1
4 APN383 VIA WIDE2-2

to something like this:
3 APN383 VIA WIDE
4 APN383 VIA WIDE,WIDE

And for the time being, I would suggest that you also change the line:
MYALIAS disabled
to
MYALIAS RELAY

This will set your digi up as an old-style RELAY station for those around that use the old settings. Once WA4KJH-7 is changed to support the new WIDEn-N stuff, then I would set MYALIAS as you have it, but until that time, RELAY would make it more useful.

As always - this is just my opinion...there are others on this list with much more knowledge and experience than I.

On Fri, September 30, 2005 10:16 pm, Travis J. Maclay said:

716. Re: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-01 05:10:25 UTC
From: richdea2000
Topic: 712 Message: 716

2 things. If its a KPC3 with ver 8.3 firmware, then it doesnt handle
WIDE1-1,WIDE2-1 paths correctly as its setup now. You have to add
WIDE1-1 to the UIDIGI list like this:
UIDIGI ON WIDE1-1,WIDE4-4,WIDE5-5,WIDE6-6

Also on findu.com it shows up with a 'T' overlay, it should be an 'S'
to show it supports state routing plus the newer settings.

In my opinion who cares if it shows up on findu.com just so long as it
supports the proper paths. You might make the paths WIDE,WIDE2-1 that
way the digi's with the newer settings would send it 1 more hop once
it has cleared WA4KJH-7 digi. The unproto looks correct if its a KPC3
with ver 8.3 firmware. I also wouldnt support RELAY. The only way to
get rid of the older settings is to stop supporting it at the digi level.

Feel free to contact me direct if you need any help.

717. Re: [EastTNAPRS] Re: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-01 17:09:25 UTC
From: William McKeehan
Topic: 712 Message: 717

I suggested supporting RELAY - the primary reason is that our big digi, WA4KJH-7 does not yet support the new N-N stuff, so many of us are still using the old settings and run RELAY,WIDE - supporting RELAY will let N4TJM-1 relay packets from these stations to WA4KJH-7, then to the wider area.

Once WA4KJH-7 is converted, then I totally agree - we can get everyone to switch to the new settings.

718. Re: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-02 14:38:21 UTC
From: William McKeehan
Topic: 712 Message: 718

I've been watching my packets for the last couple of days and I do
not see that N4TJM-1 has digi'd any packets.

Has anyone else seen any packets digi'd via N4TJM-1 ?

Travis, did you enable the RELAY alias? Do you have any way to tell
what packets are heard direct at N4TJM-1? It does not respond to the ?
APRSD query. I'm currious to know what coverage it has.

Who is hearing N4TJM-1 direct? I do not hear it direct at my QTH.

719. Re: [EastTNAPRS] Re: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-02 16:08:31 UTC
From: Ben Sager
Topic: 712 Message: 719

It is 11 miles from me and I see it direct. I don't
know on whether it has actually "digi'd" anyone
though.

720. Re: [EastTNAPRS] New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-02 23:07:52 UTC
From: David Hoffman
Topic: 712 Message: 720

A couple of things that I noticed.?
1) BLT, looks like you are using the "START" option.? This means that you are asking your station to stop transmitting at 2400 hours which is 8 PM local time and start transmitting at 4 AM, 4:10 AM, 4:20 AM & 4:50 AM.? Not sure why you would want to do anything like these times?
2) You are also using the BEACON EVERY 10 minutes, so you are doubling up on your beacons through out the day.? This one would keep on beaconing right through the night however.
3)? What ALIAS are you using?? Let us see the output of the DISP ID command.? You can remove anything you have in the RTEXT field, if you are using that, before you send us the output.? I would do an "ALIAS RELAY" here.
4) Since you are stationary, I don't see any reason to populate all four of the LT fields other then to use a different path at different times.? That's all that will do for you.
5) LTP 1 & 2 need to be filled with a VIA.? I would try something like "APN383 VIA WA4KJH-7" in these two fields.
6)? UIDIGI, what's this about?? I would use the lower numbered WIDE's here.? Just my thought.? I would use "UIDIGI ON WIDE2-2,WIDE1-1" here.
7)? I would not use BEACON and BTEXT fields at all.

These are my comments, I may have more.? I may totally wrong here to.? I'll listen and see what everyone else thinks about these as well.? Thanks
David Hoffman - KE4FGW

721. Re: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-02 23:47:24 UTC
From: William McKeehan
Topic: 712 Message: 721

David, I think most of these settings came from a file that Bob, WB4APR, has provided on his web site.

http://web.usna.navy.mil/~bruninga/aprs/fix14439.html

And they are explained step-by-step here:

http://web.usna.navy.mil/~bruninga/aprs/kpc3+WIDEn.txt

Most of your questions are answered in those web pages; for example, the BLT and LTP settings result "in a local ID once every 10 minutes, one hop every 30 mins and 2 hops every 60 minutes."

The primary purpose is to let people who need to know about the digi know about it without flooding the network with packets every 10 mins.

On Sun, October 2, 2005 7:06 pm, David Hoffman said:

722. Re: [EastTNAPRS] Re: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-03 01:14:27 UTC
From: David Hoffman
Topic: 712 Message: 722

I'll have to go review those documents in which this URL points me to.? I suspect again that all of this is Bob's wishfull thinking for everyone, his "ideal" digi.? I personally can't see why a stationery digi would want to beacon any faster then once an hour.? You can still be a digi and retransmit what you hear when you hear these stations, but to actually beacon more often then 60 minutes is beyond me.? Travis is using the BLT and the BEACON fields which serve two different tasks.? So there is some duplication going on there as to how often his station beacons.

From: Kevin R. Colvin
Topic: 712 Message: 723

Could the beaconing rate have something to do with staying legal, Stations must transmit ID every ten minutes and after last transmittions. All voice repeaters id at 10 minutes.

Just a wild guess-Kevin ? KF4YMC

"Even if you win in the rat race. You're still a rat."

724. Re: [EastTNAPRS] Re: New digi up & running

Topic: 712 Message: 724

I think the station still sends out an ID packet to keep you legal.? That only happens if you've transmitted something in the last 10 minutes.? I notice my station sends out those ID packets even though I have my BEACON rate disabled.? I use the BLT and LTP settings that are a part of the GPS portion of these TNCs.? Which in the Kantronics KPC3s are the 3+ which are versions 8.2 with an upgrade, version 8.3 and the newer 9.0.? I think this is a good question though?and deserves a little reading or investigation to find out?the answer.

I think the "keep you leagal beacon" is a function of the HID setting - which Bob recommends be set to OFF, thus using BLT and LTP settings to control the beacon rate (and VIA).

Do read the docs - I know that Bob's ideas are not always best, but this plan has been hashed out by a number of people and seems to be working well in a number of areas.

On Sun, October 2, 2005 9:35 pm, David Hoffman said:

From: Travis J. Maclay
Topic: 712 Message: 726

David, thanks for your comments.

I will repsond to your comments in the same number fashion as you have, to keep things coherent. My response #1 is related to your comment #1, etc.

1) BLT: The BLT parameter controls the timing of when the LT buffers are sent. We can control how often the buffers are sent, and also when they start. It is not based on the time of day (4:00 a.m., etc), but rather, 10 minutes, 20 minutes etc after the hour.

BLT 1 E 00:30:00 START 00:00:00
Here we are setting BLT 1 up so that the TNC sends LT 1 once every 30 minutes at the top of the hour, and then again at 30 minutes past the hour, with no digipeat.

BLT 2 E 00:30:00 START 00:10:00
Here we are setting BLT 2 up so that the TNC sends LT 2 once every 30 minutes at 10 minutes past the hour, and then again at 40 minutes past the hour, with no digipeat.

BLT 3 E 01:00:00 START 00:20:00
Here we are setting BLT 3 up so that the TNC sends LT 3 once per hour at 20 minutes past the hour, and it is digipeated to a path of WIDE2-1 (one hop).

BLT 4 E 01:00:00 START 00:50:00
Here we are setting BLT 4 up so that the TNC sends LT 4 once per hour at 50 minutes past the hour, and it is digipeated to a path of WIDE2-2 (two hops).

2) Just following Bob's recommendation here. I defer to William on this one.

3) Alias (aka MYALIAS) is disabled. Again, based on Bob's recommendations due to other settings being set properly, not needed. What I included is a DISP. Are there other parameters you were expecting to see and did not? If so, I'll check again, but this was a DISP directly copied to a TXT file.

4) Bob's recommendation is that all 4 LT fields be identical. His reasoning? Here it is:
LT 1 !DDMM.hhNSDDDMM.hhW#PHGphgd/W3,SSn new digi in kalamazoo, etc
LT 2 !DDMM.hhNSDDDMM.hhW#PHGphgd/W3,SSn new digi in kalamazoo, etc
LT 3 !DDMM.hhNSDDDMM.hhW#PHGphgd/W3,SSn new digi in kalamazoo, etc
LT 4 !DDMM.hhNSDDDMM.hhW#PHGphgd/W3,SSn new digi in kalamazoo, etc
all of the LTexts should be identical so the Position Beacon is

not always changing and using up the new-posit LOG files on every user's PC...

5) Based on the DISP output below, the LTP fields do contain a via, they just contain a via with wide2-1 instead of WA4KJH-7. I am toying back and forth between that and APN383 VIA WIDE,WIDE instead based on William's post.

6) Here's Bob's thoughts:
Set UIDIGI ON, WIDE4-4, WIDE5-5, WIDE6-6, WIDE7-7. These specific aliases act like traps because this digi will digipeat them once and then no farther. The closer you get to a high density area, the smaller N's you should limit. In typical WIDE2-2 METRO areas, set UIDIGI to include WIDE3-3,WIDE4-4,WIDE5-5,WIDE6-6. Also, if you are getting lots of W4-1 packets, for example, from a distant city that is not trapping 4-4 at the source, you can also trap those specifically by adding WIDE4-1 to your UIDIGI alias list. For more on this be sure to see how we did it in Los Angeles, and prevented anything above two hops from getting into the Los Angeles Basin.

7) Your UNPROTO path for the BText should only be DIRECT (no VIAs) since it is used for your local BText which should contain information only of *local* value.
BEACON E 10 <== every 10 minutes direct

Finally, here were my main thoughts behind not toying around too much, and that is based on Bob's final statement on his page referring to KPC-3+ digi settings:
"That's all there is to it. Please don't diddle with any other parameters. The defaults for those are the correct settings. If you dink with them you can only make performance worse. Also please use the consistent abbreviations for Wn,Sn so users know what is going on."
de WB4APR, bob

If anyone has further thoughts, I'm very interested.

Travis

Subject: Re: New digi up & running

A couple of things that I noticed.
1) BLT, looks like you are using the "START" option. This means that you are asking your station to stop transmitting at 2400 hours which is 8 PM local time and start transmitting at 4 AM, 4:10 AM, 4:20 AM & 4:50 AM. Not sure why you would want to do anything like these times?
2) You are also using the BEACON EVERY 10 minutes, so you are doubling

up on your beacons through out the day. This one would keep on
beaconing right through the night however.
3) What ALIAS are you using? Let us see the output of the DISP ID
command. You can remove anything you have in the RTEXT field, if you
are using that, before you send us the output. I would do an "ALIAS
RELAY" here.
4) Since you are stationary, I don't see any reason to populate all four
of the LT fields other then to use a different path at different times.
That's all that will do for you.
5) LTP 1 & 2 need to be filled with a VIA. I would try something like
"APN383 VIA WA4KJH-7" in these two fields.
6) UIDIGI, what's this about? I would use the lower numbered WIDE's
here. Just my thought. I would use "UIDIGI ON WIDE2-2,WIDE1-1" here.
7) I would not use BEACON and BTEXT fields at all.

These are my comments, I may have more. I may totally wrong here to.
I'll listen and see what everyone else thinks about these as well.
Thanks

David Hoffman - KE4FGW

<!--StartFragment-->We have too many digis beaconing too often and inefficiently. And some use the HID packet which is useless on APRS and just sixtuples QRM.

The following is the recommended digipeater settings that will assure not only fully legal operation, but also quick local reaction times, regional coverage, and yet lighten the load on the network significantly. The idea is for the DIGI to make itself known locally every 10 minutes (direct) and less often further out. This assures that new arrivals or someone just turning on their radio will be updated to all working local assets within 10 minutes, yet not add too many packets elsewhere.

This is important for the mission of APRS as a come-as-you-are real time responsive system. The network should support the convergence of lots of mobile and portable operators arriving in an area under stress who have no local knowledge of the system. THey expect to be updated in 10 minutes from arrival. To those 24/7 fixed stations that just monitor APRS in its static benign daily condition, these rates may appear excessive, but remember, 24/7 inactivity is NOT the mission of APRS...

HID OFF: First turn HID OFF. This ID packet is not an APRS format and uses the same path as the UNPROTO and goes out every 10 minutes if on. This, plus a bad UNPROTO path of 3 hops generates almost 100 HID packets per hour per digi in the area. HID must be turned off, because by default the TNC has it on.<!--EndFragment-->

kEVIN

I'll have to go over Bob's documentation before I make too many more?comments.? I will comment about the number 1 reply of yours.? I know from personal experience that if you use the "START" option of the BLT command, that in fact the unit starts transmitting at that given time you specify, but stops transmitting at 2400 hours.? So with our local time of being -4 hours Zulu, that would be starting at 4 AM and stopping at 8 PM.

731. Re: [EastTNAPRS] RE: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-03 14:12:56 UTC
From: William McKeehan
Topic: 712 Message: 731

I'm not familiar with the BLT lines - you seem to be, so let me see if I understand what you are saying.

The settings are currently as follows:

>> BLT 1 E 00:30:00 START 00:00:00
>> BLT 2 E 00:30:00 START 00:10:00
>> BLT 3 E 01:00:00 START 00:20:00
>> BLT 4 E 01:00:00 START 00:50:00

I would assume timezone used for the START would be the same time used to determine the STOP - so if it's starting at 00:00:00 and then stopping at 2400 - would that not be 24 hours?

Help me understand the logic of what the KPC3+ is doing.

Thanks!

From: William McKeehan
Topic: 732 Message: 732

If anyone can help - contact Dan.

---------- Original Message ----------
Subject: Mobile mission control vehicle
From: "Daniel Bowen" <dbowen1@...>
Date: Sun, October 2, 2005 12:14 pm
To: "UTARC Chat" <chat@...>

Hi all,
We'd like to have a mobile mission control vehicle - this will
be where we will uplink commands to the balloon, log telemetry and update
path predictions from. We have several visitors and media members that we'd
like to have in that vehicle, so it would need to be a large van for at
least 6 passengers, plus room to set up a small table to put the laptops and
radios on. (lol does anyone own a
bus?) Here's what I'm thinking of having onboard:

inverter, 12v power tap bus
120v power strip
2m flight data radio and backup
440 voice radio
2m / 440 mag mount antennas
table/mounts for radios, computers
Laptops, 2 - flight control/telemetry, tracking/path prediction

Let me know if you know of a vehicle we could use and if you'd like to work
on putting it together! Ask around in other club too if you could.
Thanks
Dan Bowen

733. Re: [EastTNAPRS] RE: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-03 15:23:36 UTC
From: David Hoffman
Topic: 712 Message: 733

I noticed that in the manual, they don't mention anything about the stopping time.? What happens is though that no transmissions for that LT slot will occur until the START time has been reached for that day.? When it does start, it will beacon until 2400 hours UTC time has been reached for that day.? The setting of?"GPSTIME? VALID RMC" means that the TNC will adjuct it's time based on UTC time coming from the GPS.? At any rate, we are 4 hours behind UTC time.? So a setting that STARTs at 00:00:00 will not start until 8 PM local time.? It will end at 8 PM local time.? So there is no need to be using the START option of the BLT command set for 00:00:00.? The 4 AM thing I mentioned earlier was a mis-calculation in the wrong direction on my part.? I use a START parameter of 12:00:00 which means don't start transmitting until 8 AM that day.? The only down side to using the START parameter is that when 2400 hours UTC time is reached, it stops transmitting.? Which is at 8 PM local time for us.? The only thing that the START parameter does in Travis' case is delay each of the LT buffers by that many minutes to stagger the beacon rates of those paths in the LTP command.
Travis, since you have $GPGGA in the GPSHEAD 1 slot, and if you have a GPS connected, then LT 1 will get overwritten.? If you have no GPS connected, which is very likely for a stationary station, then I would leave all of the LT slots empty for the GPSHEAD command.
Also Travis, if you connect to N4TJM-7, you can list out the stations that you hear directly.?
J(heard)
Displays a list of stations recently heard by the TNC. The list will include a date and time stamp indicating when each station was heard.
J(heard) S(hort)
This command is similar to the J(heard) command above, but only displays the callsigns of the stations heard.
J(heard) L(ong)
This command is similar to the J(heard) command above, but also displays any digipeaters used by the stations it has heard and the destination callsign.
BLT n {EVERY | AFTER} hh:mm:ss [START hh:mm:ss] [CLEAR] (n = 1 - 4)
?
default EVERY 00:00:00 (for each of the 4 LT strings)
?
This command (used with GPS) sets the interval between beacons for the
associated LT (Location Text) string.
?
n identifies which LT is used (1-4). If EVERY is specified, the LT will be
transmitted at the interval specified by the hh:mm:ss parameter. This is set in
hours:minutes:seconds, and all characters must be specified. If the optional key word START is given followed by a time (in 24 hour format), the beacons will not be transmitted until the specified time. The beacon will then be transmitted according to the setting of the EVERY parameter. (NOTE: If the current time is past the start time, the beacon will start at the next scheduled interval based on the start time.)
?
If AFTER is specified, the beacon will be transmitted once after no activity is detected on the channel for hh:mm:ss time. Selecting AFTER does not allow the optional START parameter.

?
For example, setting BLT 3 EVERY 00:15:00 START 03:30:00 would cause the third LT string (LT 3) to be transmitted every 15 minutes, with the first transmission each day occurring at 03:30:00.
?
If CLEAR is specified, the LT buffer is cleared after transmission. This way no copies of a NMEA string are repeated.

From: William McKeehan
Topic: 712 Message: 734

I've been thinking about this today. If this was the setting for WA4KJH-7, it would make sense to me.

However, a "RELAY" type digi (i.e., a digi without wide coverage), may only digi one packet an hour. For those digi's, I would totally agree with you - the HID option would keep them legal and the once an hour would let everyone know where the station is.

Currently, N4TJM-1 is setup as a WIDE digi under the new paradigm - I wonder - should it be?

What should be the criteria for a WIDE digi? In an earlier thread, John Moyers stated: "Originally only Stations that could cover a 50 miles radius minimum were supposed to be wide." Is this a good recommendation for today?

From: William McKeehan
Topic: 712 Message: 735

I suspect that the fragment below is from one of Bob's web sites - it sounds like something from him.

In general, I would agree with his statements, but I question the come-as-you-are aspect of the system. I have not heard of anyone using APRS for an event without 1) one person/group owning the hardware (trackers/digi's, etc) or 2) having a group pre-plan and dictate the hardware and settings that can be used during their event.

On Mon, October 3, 2005 4:41 am, Kevin R. Colvin said:

736. Re: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-03 16:39:46 UTC
From: richdea2000
Topic: 712 Message: 736

You guys are overthinking this.

BLT 1 EVERY 00:30:00 START 00:00:00
BLT 2 EVERY 00:30:00 START 00:10:00
BLT 3 EVERY 01:00:00 START 00:20:00
BLT 4 EVERY 01:00:00 START 00:50:00

The START times are when to start the EVERY. BLT 1 above means to send LT 1 via the path set in LTP 1 but at 0 minutes past the hour.

BLT 2 above means to send LT 2 via LTP 2 path at 10 minutes past the hour. This way the 2 beacons dont transmit at the same time every 30 minutes.

BLT 3 above says to send LT 3 via LTP 3 every hour but 20 minutes past the hour

BLT 4 says to send LT 4 via LTP 4 every hour but 50 minutes past the hour

There is no need to set the clock in a digi unless you just want to know about WHEN stations are heard in the heard list.

The BLT 3 and BLT 4 are for longer paths so you dont flood wide2-2 or larger paths every few minutes, but once an hour for each.

The above settings should send a aprs packet every 10 minutes without duplicates and keep from having to send HID packets or BEACON packets as they are not needed.

We have our digi's set to WIDE2-1 in LTP 2, WIDE2-2 in LTP 3, and TN3-3 in LTP 4 in west TN. I know your settings will differ because of WA4KJH-7 but you get the idea.

Make sure the UNPROTO is set to just APN383 and HID is OFF. No need for those unneeded non aprs packets cluttering up the airwaves.

Richard
KB4YTM

You can reference Bob's page here about digi rates:
http://www.ew.usna.edu/~bruninga/aprs/digi-rates.txt

--- In EastTNAPRS@yahoogroups.com, "David Hoffman" <ke4fgw@i...> wrote:
> I noticed that in the manual, they don't mention anything about the stopping time. What happens is though that no transmissions for that LT slot will occur until the START time has been reached for that day. When it does start, it will beacon until 2400 hours UTC time has been reached for that day. The setting of "GPSTIME VALID RMC" means that

the TNC will adjuct it's time based on UTC time coming from the GPS. At any rate, we are 4 hours behind UTC time. So a setting that STARTs at 00:00:00 will not start until 8 PM local time. It will end at 8 PM local time. So there is no need to be using the START option of the BLT command set for 00:00:00. The 4 AM thing I mentioned earlier was a mis-calculation in the wrong direction on my part. I use a START parameter of 12:00:00 which means don't start transmitting until 8 AM that day. The only down side to using the START parameter is that when 2400 hours UTC time is reached, it stops transmitting. Which is at 8 PM local time for us. The only thing that the START parameter does in Travis' case is delay each of the LT buffers by that many minutes to stagger the beacon rates of those paths in the LTP command.

Travis, since you have $GPGGA in the GPSHEAD 1 slot, and if you have a GPS connected, then LT 1 will get overwritten. If you have no GPS connected, which is very likely for a stationary station, then I would leave all of the LT slots empty for the GPSHEAD command.

Also Travis, if you connect to N4TJM-7, you can list out the stations that you hear directly.

J(heard)

Displays a list of stations recently heard by the TNC. The list will include a date and time stamp indicating when each station was heard.

J(heard) S(hort)

This command is similar to the J(heard) command above, but only displays the callsigns of the stations heard.

J(heard) L(ong)

This command is similar to the J(heard) command above, but also displays any digipeaters used by the stations it has heard and the destination callsign.

BLT n {EVERY | AFTER} hh:mm:ss [START hh:mm:ss] [CLEAR] (n = 1 - 4)

default EVERY 00:00:00 (for each of the 4 LT strings)

This command (used with GPS) sets the interval between beacons for the

associated LT (Location Text) string.

n identifies which LT is used (1-4). If EVERY is specified, the LT will be

transmitted at the interval specified by the hh:mm:ss parameter. This is set in hours:minutes:seconds, and all characters must be specified. If the optional key word START is given followed by a time (in 24 hour format), the beacons will not be transmitted until the specified time. The beacon will then be transmitted according to the setting of the EVERY parameter. (NOTE: If the current time is past the start time, the beacon will start at the next scheduled interval based on the

start time.)

If AFTER is specified, the beacon will be transmitted once after no activity is detected on the channel for hh:mm:ss time. Selecting AFTER does not allow the optional START parameter.

For example, setting BLT 3 EVERY 00:15:00 START 03:30:00 would cause the third LT string (LT 3) to be transmitted every 15 minutes, with the first transmission each day occurring at 03:30:00.

If CLEAR is specified, the LT buffer is cleared after transmission. This way no copies of a NMEA string are repeated.

737. Re: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-03 16:46:10 UTC
From: John Moyers
Topic: 712 Message: 737

William,
To answer your question about Wide and area of Coverage. It is a Yes and No answer. This gets into Location, Location, Location. We can down grade this distance a little, lets say to a 25 mile radius. Can the digi reliably work all stations within it's 25 mile radius coverage. This isn't diameter. Look at a map and use a piece of string that is scaled for 25 miles and run swing it in a circle.

First can the digi do 90% coverage?

Second, is there a digi already covering the same area?

Third, if #2 is true then does the new digi offer a significant enhancement? Trust me this one is tough to give a value to.

This same situation is how APRS got into the WIDE, WIDE QRM problem to start with. Everyone thought that just because they had a site on ridge top that they should be able to have a WIDE digi. It seemed that no one ever looked at the coverage already available to see if the new digi was really needed. So all they did was QRM themselves by having to much overlapping coverage.

Years I ago I suggested to Bob that we look at having WIDE and MID/LOCAL digi's. This would have cured the problem a lot faster with a lot fewer headaches. Wide's are simply Wide Coverage, as in 2 or more counties within it's footprint.

So with this new digi let's look at what happens when someone close by beacons Wide, Wide. For sake of this discussion lets go ahead and say that both can do WIDEN-n

KI4HDU beacons to WIDE3-2

This beacon is heard by KJH-7 and TJM-1, both will rebroadcast it since they both can handle the path.

The Signal from KJH-7 is heard by 4 other digis who are 40 miles away in different directions and the beacon will propagate through the system.

The signal from TJM-1 may not beheard by any other WIDE because they are out past it's 25 mile coverage area.

The problem is that everyone within it's 25 mile coverage also heard the broadcast from KJH-7 and it was nothing more than a duplicated transmission. On this surface this isn't a big deal.

What you don't see is that TJM-1 keyed up at the same time one of the distant wides keyed and caused a packet crash at KJH-7. This means that a packet from one of the distant wides was not carried by KJH-7 and you have lost data. The problem is not the use of WIDE, WIDE or WIDEN-n, it's from to many low coverage WIDE's.

The cure for this would be to decide that digi coverage should only be 25 miles and those that cover a larger area should be removed from service in order to reduce the channel loading. If you want to see what KJH-7 has to listen to, take a drive some time up to Clingman's Dome or Top of the World and monitor with a TNC and laptop. Pay close attention to the number of Packets that you will not decode due to all the hidden transmitters keying up at the same time because they can't hear each other. I have seen KJH-7 sit with full buffers waiting to broadcast for 2 or 3 minutes before the traffic slows down enough so it can key up.

The Hidden WIDES with low coverage are the real problems and all the new paradigms do is mask, cover, and bandaid it. But we've been dealing with this for years.

Hope this helps some with understanding the problems.

From: tjmaclay@charter.net
Topic: 712 Message: 738

I may be wayyyyy off base here, and could possibly be even farther off base after reading David's response just a minute ago, but here is (was) my understanding of the BLT times.

BLT 1 E 00:30:00 START 00:00:00
Send contents of LT 1 every 30 minutes. This should start immediately once the command is set into the TNC or the TNC is turned on. This should be sent via the path set in LTP 1 (APN383).

BLT 2 E 00:30:00 START 00:10:00
Send contents of LT 2 every 30 minutes, but send it 10 minutes after the command is set into the TNC or the TNC is turned on. This should be sent via the path set in LTP 2 (APN383).

BLT 3 E 01:00:00 START 00:20:00
Send contents of LT 3 every 60 minutes or one hour, but send it twenty minutes after the command is set into the TNC or the TNC is turned on. This should be sent via the path set in LTP 3 (APN383 VIA WIDE).

BLT 4 E 01:00:00 START 00:50:00
Send contents of LT 4 every 60 minutes or one hour, but send it fifty minutes after the command is set into the TNC or the TNC is turned on. This should be sent via the path set in LTP 4 (APN383 VIA WIDE,WIDE).

Hence, if TNC is set or turned on at 0800 hours EST, here would be a five-hour schedule of BLT times:

8:00 a.m. Send LT 1 (APN383)
8:10 a.m. Send LT 2 (APN383)
8:20 a.m. Send LT 3 (APN383 VIA WIDE)
8:30 a.m. Send LT 1 (APN383)
8:40 a.m. Send LT 2 (APN383)
8:50 a.m. Send LT 4 (APN383 VIA WIDE,WIDE)
9:00 a.m. Send LT 1 (APN383)
9:10 a.m. Send LT 2 (APN383)
9:20 a.m. Send LT 3 (APN383 VIA WIDE)
9:30 a.m. Send LT 1 (APN383)
9:40 a.m. Send LT 2 (APN383)
9:50 a.m. Send LT 4 (APN383 VIA WIDE,WIDE)
10:00 a.m. Send LT 1 (APN383)
10:10 a.m. Send LT 2 (APN383)
10:20 a.m. Send LT 3 (APN383 VIA WIDE)
10:30 a.m. Send LT 1 (APN383)
10:40 a.m. Send LT 2 (APN383)
10:50 a.m. Send LT 4 (APN383 VIA WIDE,WIDE)
11:00 a.m. Send LT 1 (APN383)
11:10 a.m. Send LT 2 (APN383)

11:20 a.m. Send LT 3 (APN383 VIA WIDE)
11:30 a.m. Send LT 1 (APN383)
11:40 a.m. Send LT 2 (APN383)
11:50 a.m. Send LT 4 (APN383 VIA WIDE,WIDE)
12:00 p.m. Send LT 1 (APN383)
12:10 p.m. Send LT 2 (APN383)
12:20 p.m. Send LT 3 (APN383 VIA WIDE)
12:30 p.m. Send LT 1 (APN383)
12:40 p.m. Send LT 2 (APN383)
12:50 p.m. Send LT 4 (APN383 VIA WIDE,WIDE)
1:00 p.m. Send LT 1 (APN383)

Based on my knowledge of this and this layout, I do not see any start or stop time mentioned. I would think the TNC would continue to operate like this 24 hours a day no matter what real-time is. I have not verified that my TNC has or has not transmitted at all during a certain period or time of day.

Can you give further insight into whether or not my understanding from above is accurate or am I way off base here?

Travis

Yes Travis, that is correct. You are right on the money in the way the beacon rates work.

Sort of what I was trying to say, funny way of doing it though.? You could do the same thing without using all 4 LT slots.?

Yes, I think you have it.? I saw that you were using the START option and therefore started something here about start and stop times.? I see though that you are using this option to stagger the beacon rates of different paths so as not to step on each other.? My use of the START option was to keep the APRS box quite during the night when it wasn't being used.? I used a START time of 12:00:00 which actually delayed the box from transmitting for 12 hours, between 8 PM to 8 AM.? Your use of the START option is used in a different way here which I've found to be an interesting concept.? I still don't understand why there is no VIAs in the first two LTP commands.? I'm not sure what this would do if it even gets digi'ed by anyone else.? I've still got Bob's doc to look through yet though.

742. Re: [EastTNAPRS] RE: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-03 18:37:04 UTC
From: David Hoffman
Topic: 712 Message: 742

He does mention in his example of turning on the TNC right at 8:00 AM and plotting from there, forward what would happen, time wise.? I say nothing would happen for the next 12 hours, then you would start to see something.?
This out of the Kantronics User's Guide:
(NOTE: If the current time is past the start time, the beacon will start at the next scheduled interval based on the start time.)

I thought the purpose of using all 4 LT slots was to get different VIAs so you don't always flood everywhere.

Can you give an example of how you would do it without using all 4 LT's?

I'm learning more about TNC's every day!

Well I'm still confused about why there would be no VIA's in the LTP 1 and 2 slots?? So there is some use of different paths going on here that may effect my answer.

LTP 1 and 2 have no VIA - thus the only stations that would get those packets would be the stations that hear the digi direct; I think this is done to have an identity beacon every 10 mins with the least impact on the RF environment.

Think about how many stations would hear those beacons if we were talking about WA4KJH-7.

From: tjmaclay@charter.net
Topic: 712 Message: 746
Attachments: 1 described; binary payloads are missing from this source WARC

In my particular setup, as I see it, the main purpose in there being no VIA in LTP 1 and LTP 2 is so that the more frequent beaconing of the LT 1 and LT 2 does not cover a wide distance. It is more for the local people within listening distance, which is the ultimate goal in and of itself.

For the locals or those passing through town, they do not have to wait more than 10 minutes at any time to hear the digi beacon. For a bit farther away, they only hear it every 30 minutes, and for those even really far, only once an hour.

The reasoning for the same content in all four LT slots is so that the new-posit log files on people's computer. If the LT info is identical as previous beacon's, a new position is not entered into the logfile. Does this make any sense?

Thanks for all the help thus far. I want this digi to operate if it serves a purpose. If it is needed, I want it to be effective, which only comes from using the proper settings. If it is not needed, I'll open UI-View and run a normal station. No feelings hurt either way. :-) Have a great day!

The following is my opinion - remember, I've only been doing this for a year, so I am not an expert...

I think this location has the potential to be a great location for a digi...

I suspect that this location will have a lot of overlapping coverage with WA4KJH-7. I also suspect that this location will cover some holes that WA4KJH-7 does not cover.

If you can, monitor the traffic that you see at that station. Specifically, look for packets that you hear that WA4KJH-7 does not digi (thus does not hear). If you see ANY, that have a path that WA4KJH-7 should respond to, then your digi will be adding value if you can digi those packets to WA4KJH-7 (aka, relay) which will help them get to an IGate or two.

FYI:

Ham Radio story on tonight on WVLT-TV Channel 8 at 5:30pm, 6:00pm, and 11:00pm. (Oct 3 2005)

ATV wreck on Windrock Mnt. in Oliver Springs, Anderson County on CCMC (Coal Creek Mining Company) property,
HAM operators used local repeaters and HT's to contact and guide Emergency Response teams and Medi-Vac to scene.
Severely injured 29yr male from Miami, FL recently moved to Knoxville.

Details on this story to follow. News interview of some operators involved tonight on WVLT-TV (CH.8).

From: Travis J. Maclay
Topic: 712 Message: 750

William et al,

Here is a list of the last 15 minutes or so of what I've heard @ the digi. Not sure if this helps with what you're looking for, but maybe. This was done via a MHEARD L command.

Thoughts?

Travis
N4TJM

PS - Here is the snippet from the KPC-3+ manual on the Mheard command:

----------BEGIN SNIPPET----------

MHEARD [SHORT | LONG | CLEAR]

This command causes display of a list of stations heard. An asterisk, *, indicates
that the station was heard through a digipeater. The date/time the station was last
heard is also displayed.

If the S option is used, i.e. MHEARD S, then only the callsigns of the stations
heard will be displayed.

If the L option is selected, all callsigns contained in the received packet including
the digipeater paths, are displayed. For example:

NØGRG > ID 10/16/88 14:31:30
VIA TOP,KCI,WØXI

Here, your station heard NØGRG transmitting an ID packet. NØGRG was also using the digipeating path TOP, KCI, WØXI. If your station heard NØGRG via
one of these other stations, an asterisk would show by the call or alias of the last
digipeater heard. When listed short, the asterisk would show beside NØGRG.

+ Whenever PASSALL is ON, packets will not be checked for errors and no additions
will be made to the MHEARD list.

If the C option is used, the list is cleared.
See also: daytime, passall

```
---------END SNIPPET--------------

Stations heard at N4TJM-1 / 10-03-2005

Well...on this list, I do not see any stations that you would (should) digi regardless of your settings except for a couple of WIDEn-N stations that you hear via WA4BDS:
KK4EB-15
N4NEQ-3

What we need is to put a mobile unit on the ground in the area that we believe to be the "dead zone" that your digi will fill the gap for. My schedule has me landing at McGhee Tyson around 10pm Thursday. When I land, I will setup my TT3 to beacon using a path of N4TJM-1,WA4KJH-7 and drive home. My route will take me up Alcoa Hwy to I-40 East to exit 407. This should show us how it covers that portion of the road.

Maybe some others on their way to the Balloon meeting Tuesday night can perform a similar test to see if the digi has coverage in the UT/downtown Knoxville area.

From: William McKeehan
Topic: 712 Message: 752

Well...you know about the MHEARD command - I'm not sure how much data the TNC can store in that list, but that's one place to start.

If you can connect a computer to the TNC (I have no idea how you have it setup), then you could run some software to monitor the TNC and log the data.

If you only have the TNC available, then I'm not sure - I don't have much experience with a TNC without a computer attached.

I was looking over my log this morning...I see that N4TJM-1 has digi'd some packets that I am seeing. I don't know if this is the result of some people testing different paths or if N4TJM-1 has added RELAY to his alias list. Whatever the case, I see that K4RWH, KE4FGW-9, WA4BDS and WA4SXM-10 have all been digi'd by N4TJM-1.

Travis, have you made some changes?

I am running a test.? I have one of my LT slots with a path of GPSLK VIA N4TJM-1,WIDE.? This is different in that a truck icon should be displayed if it makes it past N4TJM-1 instead of the standard car icon.? The car still has it's normal path of GPSLK VIA N4TJM-1,WIDE.
LTP
1 GPSMV VIA RELAY,WIDE
2 GPSLK VIA N4TJM-1,WIDE
3 GPSBP VIA WIDE,WIDE
4 GPS
I see findu never has seen the GPSLK VIA N4TJM-1,WIDE, but the GPSBP VIA WIDE,WIDE is getting through to findu from N4TJM-1.

From: William McKeehan
Topic: 712 Message: 756

I'm seeing both GPSMV (your standard car, correct?) and GPSBP - no sign of GPSLK yet. Maybe N4TJM-1 is not hearing you?

KE4FGW-9>GPSBP,WA4KJH-7*,WIDE:
KE4FGW-9>GPSMV,WA4KJH-7*,WIDE:
KE4FGW-9>GPSMV,WA4BDS,WA4KJH-7*:

Earlier (before 8:30, maybe yesterday) I saw these two packets:

KE4FGW-9>GPSBP,N4TJM-1,WA4KJH-7*:
KE4FGW-9>GPSBP,N4TJM-1,WA4KJH-7*:

So at that point, it's clear that N4TJM-1 was hearing and responding to your packets.

758. [Fwd: UX-3 Mission Teams Signup - we need lots of people!]

Yahoo group: EastTNAPRS
Date: 2005-10-05 22:41:36 UTC
From: William McKeehan
Topic: 758 Message: 758
Attachments: 1 described; binary payloads are missing from this source WARC

FYI

---------- Original Message ----------
Subject: UX-3 Mission Teams Signup - we need lots of people!
From: "Daniel Bowen" <dbowen1@...>
Date: Wed, October 5, 2005 6:40 pm
To: "UTARC Chat" <chat@...>

The UX-3 Balloon Mission is going to be big and exciting. So
big in fact that it needs more crew members than we had on all the previous
missions combined!
There are several teams that will be performing specific
functions during the UX-3 Mission. We need lots of volunteers to have
enough hands to do this well. There will be two main teams, the Launch
Team, and the Chase Team, made up of several smaller teams. Here is a list
of the teams available, along with the number of
people needed, and their responsibilities.
Please pass the word along to other clubs and any capable people
that might be interested. Everyone will get a chance to learn and practice
their role during the dress rehearsal on Sunday, October 16, 2005. Please
respond to me or the chat list to confirm which team you would like to be
on, ASAP. (I've listed those people that have already confirmed what they'd
like already)

Launch Team
Site and Balloon Prep (10-15 people)
The first to arrive at the launch site, 4 hours before launch. They will
transport and set up launch site equipment, cordon off the
launch site, assemble flight train, and inflate and handle balloons until
launch. We need at least 10 people on the S&B team, as we will have two
balloons to inflate and handle, and plan to inflate them simultaneously.
Jeff Napier - coordinator
Don Riley
Greg Williams
John Culver

Public Relations (1-4 people)
Arrives 2 hours before launch, before most press and spectators. Transport
and set up PR materials - signs to launch site from parking area, posters,
banners, handouts. etc. Provides interesting and exciting information and
stories to spectators and media present. Narrates the current status of the
launch preparations to the crowd. May be interviewed by press.
Coordinator - Travis Maclay

Payload Operations (3-5 people)
Arrives 2 hours before launch. Sets up ground communications equipment and computers, Performs final payload assembly, installs flight batteries, and ground powered testing, checks communications with flight computer and performs final onboard power status checks of payload components and operations. Should be familiar with payload or similar projects.
Dan Bowen
Mike Coffey
Carl Lyster

Mission Control (3-5 people)
Consists of key members of other teams and specialists. Will make critical mission decisions based on information available, from start of countdown through recovery. After consulting other members of MC, the Flight Director will make final mission decisions and verify actions needed with appropriate team.

Recovery Team
Tracking (5-20 people)- aerial/ground vehicle chase of flight, locates payload, retrieves if possible. Needs APRS and/or direction finding gear
David Hoffman - Coordinator
Tom Ogle

Deep Recovery (2-5 people)- unusual environment recovery, long distance foot travel recovery. Might want handheld APRS and/or direction finding gear
Tom Ogle

760. Re: [EastTNAPRS] Re: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-06 19:40:24 UTC
From: David Hoffman
Topic: 712 Message: 760

I compared the two lists, 9/29 vs. 10/5, and these are the differences that I have found:
HEADERLN?? OFF????????????????? - This was ON
LTP
?1 APN383???????????????????????????????? - Same as before
?2 APN383???????????????????????????????? - Same as before
?3 APN383 VIA WIDE???????????? - Was 3 APN383 VIA WIDE2-1
?4 APN383 VIA WIDE,WIDE?? - Was 4 APN383 VIA WIDE2-2
PACLEN 0??????????????????????????????? - Was 128
TXDELAY 40 (400 msec)??????????- Was 30 (300 msec)
UNPROTO APRS VIA WIDE,WIDE - was APN383
UIDIGI ON RELAY,WIDE,TRACE,TN - Was ON WIDE4-4,WIDE5-5,WIDE6-6,WIDE7-7
UIFLOOD WIDE,30,NOID????? - Was TN,30,ID
UITRACE TRACE,28??????????????- Was WIDE,30
After reading some of Bob's document, I kind of like the idea he had on trapping the larger numbered WIDEn-N packets which is what the UIDIGI command was doing.? Your BTEXT string was intended to be sent outr every 10 minutes and kept local.? This is why he had a UNPROTO of APN383.? Now with your new UNPROTO path of APRS VIA WIDE,WIDE it will be digi'ed by any digis that hear WA4KJH-7 direct.? In other words, this would be heard by a very large area every 10 minutes.? Isn't that considered QRM as well?

761. Re: [EastTNAPRS] Re: New digi up & running

Yahoo group: EastTNAPRS
Date: 2005-10-06 20:15:55 UTC
From: William McKeehan
Topic: 712 Message: 761

Well, here's what I see...

Before
3 APN383 VIA WIDE2-1
4 APN383 VIA WIDE2-2
After
3 APN383 VIA WIDE
4 APN383 VIA WIDE,WIDE

Looks like a good change - now WA4KJH-7 (and other local digi's still on the old system) will digi your packets. I am seeing this is working for you

Before:
PACLEN 128
After
PACLEN 0

I'm not sure how this will affect APRS stuff - but the setting of 0 sets no limit on the packets; I think packets over some length will break the D700's, I'll have to do some research to see what the details are on that.

Before
TXDELAY 30 (300 msec)
After
TXDELAY 40 (400 msec)

Slower radio than you suspected? This is how long it will wait after starting TX to send the packet - longer is worse for the network, but some radio's take longer to be ready to send.

Before
UNPROTO APN383
After
UNPROTO APRS VIA WIDE,WIDE

This is probably a bad choice. It defeats the multiple setups that you have for BLT and LTP. I would revert back to simple APN383.

Before
UIDIGI ON WIDE4-4,WIDE5-5,WIDE6-6,WIDE7-7
After
UIDIGI ON RELAY,WIDE,TRACE,TN

This is supporting the old standards. I don't see any problem with it except for the potential overlap with WA4KJH-7. I would consider using only RELAY in this list.

Before:
UIFLOOD TN,30,ID
UITRACE WIDE,30
After
UIFLOOD WIDE,30,NOID
UITRACE TRACE,28

Again, you have reverted to the old settings. Not a bad thing, but I would recommend that you leave these as the new standard where WIDEn-N is fully traced. Then once WA4KJH-7 is converted to the new paradigm, all you would have to change to be under the new paradigm would be your UIDIGI and your LTP settings.

And, looking at your BTEXT:
BTEXT 35.903N/083.951W N4TJM-1 Digi in So. Knoxville
It looks like you are missing a character or two. I would recommend that you set it just like your LT:
!3554.11NT08357.40W#PHG6260/W3 TNn South Knoxville Digi
Difference is that the BTEXT is not sending a valid position (missing !) and the symbol is "/ " - I'm not sure that's a valid symbol - I don't see it in my documentation anywhere; I suspect you want it to be \# with a T overlay, so T# like you have in the LT text.

That would be my opinion/recommendations...

762. Ham Radio Adventure Time!

Yahoo group: EastTNAPRS
Date: 2005-10-07 04:25:48 UTC
From: Travis J. Maclay
Topic: 762 Message: 762

Now's your opportunity! Intersted in APRS in East Tennessee? We need help!

We're just over two weeks away from launch day for UX-3, the third high-altitude balloon launch by the UT Amateur Radio Club. The launch will take place at 0800 on Oct 22, 2005 from the campus of the University of Tennessee in Knoxville. We are shooting to break the high-altitude record on this flight!

What help can you be? Glad you asked!

We need additional help in almost all areas. Site preparation, balloon preparation, mobile tracking teams, public & press relations, and many more areas. If you have an area of specialty, we could possibly need that too :->

I am formally soliciting your help! Please contact me ASAP for placement on a team. Depending on your role, you could be needed as early as 0400 hours on Saturday (launch team) until 1800 hours (tracking team). This promises to be one of your most exciting days yet as a ham.

Make plans now to join us! Simply send an email to tjmaclay@...
if you are intersted. The coordinator for your area of interest will be contacting you shortly.

Looking forward to getting many involved in this! Let's make a name for East Tennessee APRS with this launch!

73,
Travis Maclay

From: William McKeehan
Topic: 712 Message: 763

Earlier in the week I said that I would do some testing with N4TJM-1 as I returned home. Last night, I flew in to McGhee Tyson and drove from there to home via Alcoa Hwy and I-40.

During my drive, I had my TinyTrak3 connected to my monster 5-watt HT. The TT3 was configured to use a path of N4TJM-1,WA4KJH-7.

Here are the packets that made it to FindU.com (dates/times are UTC):

```
10/7/2005 03:08 KI4HDU-9>SU5Q1W,N4TJM-1,WA4KJH-7*,qAR,KI4HDU-2:`oUdq*2>/
10/7/2005 03:11 KI4HDU-9>SU5S1V,N4TJM-1,WA4KJH-7*,qAR,KI4HDU-2:`oU1psW>/
10/7/2005 03:13 KI4HDU-9>SU5T3P,N4TJM-1,WA4KJH-7*,qAR,KI4HDU-2:`oU1m*O>/
10/7/2005 03:13 KI4HDU-9>SU5T2X,N4TJM-1,WA4KJH-7*,qAR,KI4HDU-2:`oU.lT#>/
10/7/2005 03:13 KI4HDU-9>SU5T3P,N4TJM-1,WA4KJH-7*,qAR,KI4HDU-2:`oU0mhz>/
10/7/2005 03:13 KI4HDU-9>SU5T4Q,N4TJM-1,WA4KJH-7*,qAR,KI4HDU-2:`oU4oiM>/
10/7/2005 03:16 KI4HDU-9>SU5V2V,N4TJM-1,WA4KJH-7*,qAR,KI4HDU-2:`oTwpUQ>/
```

Looking at these positions on the map, it seems that N4TJM-1 heard me starting just north of the intersection of I-140 and Alcoa Hwy, and tracked me well until just before I got to the UT Hospital.

For those of you wondering what kind of packets these are, they are called Mic-E. They are the same format used by the Kenwood D7/00. In Mic-E format, the station's position, course, speed, symbol are packed into the destination address and info fiel. Mic-E packets can be very short.

From: tjmaclay@charter.net
Topic: 712 Message: 766

This email is in response to KI4HDU's comments from earlier last week. My comments follow his. Mine are in quotes to provide clarification.

Before
TXDELAY 30 (300 msec)
After
TXDELAY 40 (400 msec)

Slower radio than you suspected? This is how long it will wait after starting TX to send the packet - longer is worse for the network, but some radio's take longer to be ready to send.

"Sorry, this should not have been changed. Default is 30 and is now back to 30."

Before
UNPROTO APN383
After
UNPROTO APRS VIA WIDE,WIDE

This is probably a bad choice. It defeats the multiple setups that you have for BLT and LTP. I would revert back to simple APN383.

"This has been changed back to UNPROTO APN383"

Before
UIDIGI ON WIDE4-4,WIDE5-5,WIDE6-6,WIDE7-7
After
UIDIGI ON RELAY,WIDE,TRACE,TN

This is supporting the old standards. I don't see any problem with it except for the potential overlap with WA4KJH-7. I would consider using only RELAY in
this list.

"This has been changed to UIDIGI ON RELAY"

Before
UIFLOOD TN,30,ID
UITRACE WIDE,30
After
UIFLOOD WIDE,30,NOID
UITRACE TRACE,28

Again, you have reverted to the old settings. Not a bad thing, but I would recommend that you leave these as the new standard where WIDEn-N is fully traced. Then once WA4KJH-7 is converted to the new paradigm, all you would have to change to be under the new paradigm would be your UIDIGI and your LTP
settings.

"New settings are UIFLOOD TN,30,ID and then UITRACE WIDE,30"

And, looking at your BTEXT:
BTEXT 35.903N/083.951W N4TJM-1 Digi in So. Knoxville
It looks like you are missing a character or two. I would recommend that you set it just like your LT:
!3554.11NT08357.40W#PHG6260/W3 TNn South Knoxville Digi
Difference is that the BTEXT is not sending a valid position (missing !) and the symbol is "/ " - I'm not sure that's a valid symbol - I don't see it in my documentation anywhere; I suspect you want it to be \# with a T overlay, so T# like you have in the LT text.

"BTEXT is now !3554.11NT08357.40W#PHG6260/W3 TNn South Knoxville Digi"

"Any future thoughts or ideas are always welcome. I certainly do not know as much as some on this list, which is why I open these settings up to you guys, so we can make this digi (fill-in possibly) effective."

73,
Travis Maclay

767. UX-3 Flight Announcement

Yahoo group: EastTNAPRS
Date: 2005-10-11 04:51:42 UTC
From: Travis J. Maclay
Topic: 767 Message: 767

The University of Tennessee Amateur Radio Club (UTARC) is pleased to announce the flight of UX-3. This mission will be flown with the call of K4T-11.

This high altitude balloon flight will take place on Saturday, October 22, 2005, at 8:00 AM EDST (1200 UTC). The launch site will be the campus of the University of Tennessee in downtown Knoxville. Exact launch location will be the University Center Plaza at the corner of Andy Holt and Philip Fulmer.

Two (2) 3000-gram weather balloons filled with helium will fly in tandem. Expected burst altitude will be 100,000 feet or more. Flight time is expected to be about 2.5 hours.

The following devices will fly on this mission as part of the payload:
Primary APRS / voice telemetry
Backup APRS transmitter
433 MHz beacon
10-meter transmitter (voice telemetry)

Pre-flight path predictions are available via the internet at:
<http://www.reachingnewheights.org/ux3>
http://www.reachingnewheights.org/ux3

Information on this and previous flights can be found at
<http://balloon.utarc.org> http://balloon.utarc.org

Tracking for this flight can be located at:
<http://map.findu.com/k4t-11> http://map.findu.com/k4t-11

For more information, please contact Travis Maclay (N4TJM) at
tjmaclay@...
Thanks to KD7LMO <http://www.kd7lmo.net> for use of announcement
script.

770. UI-PHG

Yahoo group: EastTNAPRS
Date: 2005-10-12 19:02:38 UTC
From: William McKeehan
Topic: 770 Message: 770

Has anyone played with the "UI-PHG" UI-View add-on? It is an add-on for UI-View32 that can draw (P)ower, (H)eight, (G)ain circles on the UI-View map for stations reporting this information. PHG is an estimate of the station's coverage area and can be used for a number of network management tasks and for estimating a needed path.

I've been looking at PHG circles lately and would like to see more people broadcasting their PHG - currently, I only see that data from WA4KJH-7, N4TJM-1 and KI4HDU-2 in the immediate area.

PHG draws some interesting pictures that tell you a lot about the network.

771. RE: [EastTNAPRS] UI-PHG

Yahoo group: EastTNAPRS
Date: 2005-10-12 19:22:23 UTC
From: John Moyers
Topic: 770 Message: 771

William,

Keep in mind the PHG lines are only remotely helpful if the Height is based on HAAT and NOT AMSL. HAAT is Height Above Average Terrain. If you use AMSL, as in a height derived from a single point on a topo map, GPS, or Altimeter then you have insufficient data to base the HAAT from and the PHG line will not even be in the ball park of correct.

KJH-7 PHG was based on Coverage studies done 30 years ago where we drew 8 equidistant radials 10 miles long out on a TOPO map. Then every mile along each radial we read the elevation and derived that average elevation height. Back then it took some time, today using RF Engineering software it can be done in about 15 minutes with a lot greater accuracy.

John Moyers

I have played with UI-PHG and It is not something that I find usefully in everyday operations. It is good for FLATLANDS, but around here I find it useless. It shows me in two major digi areas, of which KJH-7 is not one of them and I can only hit KJH-7. One might say I need more power or higher antenna but the truth is. The itty bitty hills in the way.
I will say it was fun to play with, but I now have no use for it.

I would expect that the PHG circle should show the effective transmit range, not the range where the station can hear.

Does this correspond to your experience?

not the range where the station can hear.
Does this correspond to your experience?

I do not hear the two station except thru WA4KJH-7.
AND TRUE ITS FOR THEIR TXM. BUT I HEAR A LOT OF STATIONS THAT THEIR PHG WOULD SAY I SHOULD NOT. MY PHG SAYS I SHOULD NOT REACH KJH-7, BUT I DO. SO I SEE VERY LITTLE APPLACTATION FOR ME IN USING IT.

Good point...so what does PHG really tell us?

Anyone have any ideas?

From: John Moyers
Topic: 770 Message: 776

Guys, it may just be me but you seem to be missing some of the finer points of using PHG.

First, Kevin you are correct in that as presented in APRS it works best when used in the flat lands. Remember Bob is from the flat lands. The reason for this is that it does take terrain into account with drawing the footprint. In APRS, PHG is a simple calculation that is projected on to a flat plane. Example of this is to look at KJH-7 footprint. KJH-7 Eastern contour follows the state line with North Carolina. Why? Even at 4,000 feet AMSL elevation it is 2000 to 2600 feet BELOW the Mountains 5 miles to it's east.

Second, how many people actually know what their HAAT is? It is NOT your ground elevation. To give you an example. Sutherland Ave is about -80 feet HAAT. Yes that is correct it is about 80 feet BELOW average terrain. So a station there with a 90 foot tower would have 10 feet to entered into the PHG settings if they were correct. Most of the PHG settings are wrong due to incorrect HAAT entries.

Third, yes PHG is primarily a look at the TX coverage area. However, IF the station is setup and balanced between it's receive sensitivity and transmit power they should be about the same coverage. Meaning a 30 watt station should be able to hear another distant 30 watt station with an equal receiver signal level at both ends. This is providing both receivers have the same sensitivity levels. In the case of KJH-7 it has a receiver sensitivity of about 0.35 uV @ -10db sinad. Most new 2m ham rigs have a receiver sensitivity of about 0.20 uV @ -10db sinad or better. So given this comparison, KJH-7 will not hear the newer radio nearly as well as the new radio will hear it if both stations are running the same power levels.

So Kevin in many ways you are correct, the PHG in APRS is not much more than a guesstimate of coverage. Unless the operator has entered his correct power level, deducted the coax loss from the antenna gain, and has correctly calculated his HAAT it is probably even a bad guesstimate. My real question is in it's calculation is their gain figures used in the calculation based on DB-I or DB-D? There is about 1.6 db difference depending on what the db scale is based on.

John Moyers, N4QEA

Topic: 770 Message: 777

Ok William, remember all of this is relative. PHG I suspect is looking at how far you can be heard by a mobile station at 0 HAAT, meaning ground level on a flat plane. In the case of KJH-7 used in Kevins example you are talking to a mountain top and have to rely on KJH-7's PHG calculation.

If you want an even harder path to apply PHG to consider that KJH-7 can hear the digi on Short Mtn just east of Nashville direct when the frequency is quiet in a 200 mile radius. This is propagation from mountain top to mountain top. Remember 2m are line of site, and 1 watt will talk as far as you can see. Why else can you talk on a 1 watt portable from Clingman's Dome thru the 146.76 repeater that used to be on Stone Mountain in Atlanta? This is why wide digi's need to be HIGH.

Hello David,

Looks like this person is using a Kenwood radio (either d7 or d700)
but with no gps data. You can tell by the:
KB4QBE>APK101,RELAY,WIDE

The APK101 indicates a kenwood rig. Just like your APS227 indicates
APRS+SA version 2.27.

Other than that may have to drop him an email or something. We had a
similar one here recently. When I emailed him he said someone had
stolen his gps from his rooftop and he forgot to shutoff the aprs part
of his kenwood.

Hope this helps,
Richard

Hello everyone,

We really, truly, earnestly, emphatically, definitively, unquestionably need more volunteers for the launch. As of now, we have only two volunteers for the fill team; we need 6-11 more. It cannot be emphasized enough that we need more volunteers. Please talk to your friends, relatives, anybody who might be able to help. It will be extremely difficult to proceed without more hands. The launch team will receive instruction ahead of time; no experience is required.

73,
Mike

Kevin,
You are exactly right. We are working on getting the local amateurs more involved with the emergency services folks.
I just did a demo to the local fire school last night about the capabilities of the local amateur operators. We generated so much interest that
about 20 people signed up to take a club sponsored ham radio class. Last I heard we can't use any facet of amateur radio for commercial use.

787. SPECIAL ATTENTION UI-VIEW USERS.....

Yahoo group: EastTNAPRS
Date: 2005-10-23 02:31:39 UTC
From: ff943
Topic: 787 Message: 787

I know that in the Knoxville area, the big digi's use Wide.
Although some users prefer to use wideN-n. Picking a Path to get the best of both is, well lets just say hard. I have been playing with UI-View and think I found a way to send two seperate beacons, with two seperate paths.
I live in an area where one area is covered under the Wide par. and another area is useing WideN-n par.
I am currently trying this out ON-AIR. I have tried it out OFF-AIR and it seemed to work great.
I am sending out one beacon as WIDE,WIDE. And the other as WIDE2-2.
I am running a history log to see what I can that way. I have the rate set for 30 minutes. So every 30 minutes I send out a Wide,Wide packet and about 1 minute later a Wide2-2 Packet.
This dose create more packets being sent out. Although it is the only way I have found to take advantage of both Par. and keep it kinda local.
A WIDE,WIDE2-1, gets me a long way, but if KF4CFO-7 digi's me out and WA4KJH-7 didn't hear me direct, Then a lot of Knoxville dose not hear me.. A Wide, Wide is great but doen't use the new par.

What I have done is use the "METEOR" set-up/mode

What I did was go to meteor set up in the "set-up options tab". put in the path I wanted,(APRS,WIDE2-2) select "posit", the set the seconds to "1800". You can add information after the posit data, ie:My Home Station. (I choose not to.)
After I set the settings, I then went to the Option setting tab and selected Meteor mode.

Now I have two seperate beacons sending out two differant paths.

The first beacon is the one UI-View normally uses. and the second one if from meteor mode. Your icon will be set to the same as your primary UI-View beacon.

2005-Oct-22 19:32:00 (local)
19:32:00R KF4YMC>APU25N,KF4CFO-7*,WA4KJH-7* Port=2 <UI C Len=35>:
=/<OAX9+os- B.kf4ymc@...

2005-Oct-22 19:33:19 (local)
19:33:19R KF4YMC>APRS,WIDE2-1 Port=2 <UI C Len=21>:
=3534.75N/08434.26W-

This option is not for everyone, but there are some that live in area's that this might help.

I make no promises that this work for you, but for the last 8 hours it has worked for me.

Comments are welcome. If you need to : kf4ymc@...

Subject: [EastTNAPRS] SPECIAL ATTENTION UI-VIEW USERS.....

Additional comment on the path set-up:

When using the "meteor option" for a second beacon. And you set the METEOR PATH. UI-View 32 users should use APU25N vs APRS to start this path in METEOR setup only. This will reflect to others that you are using UI-View 32.

If you use "APU25N" to start this path, your beacon will reflect like this: 19:32:00R KF4YMC>APU25N,Wide2-1 Port=2 <UI C Len=21>:
=3534.75N/08434.26W-

If you use "APRS" to start this path, your beacon will reflect like this:
19:33:19R KF4YMC>APRS,WIDE2-1 Port=2 <UI C Len=21>:
=3534.75N/08434.26W-

Also the Icon Lable using "APU23N" will stay Yellow (or what color you have set to reflect UI-View users). Using "APRS"the lable shows up white on mine.

Comment on beacon rate:

If you only want to beacon 1 time an hour, you must set the seconds (in mode : interval) to 3600.
PLEASE REMEMBER NOT TO USE EXCESIVE HOPS. TOO MANY HOPS ONLY CREATES QRM, AND THE CHANCES OF GETTING THEM DIGIED OUT DECREASES WITH THE NUMBER HOPS YOU USE.

Comments are welcome. If you need to : kf4ymc@...

789. UI-View as Digi Comments

Yahoo group: EastTNAPRS
Date: 2005-10-23 17:41:41 UTC
From: ff943
Topic: 789 Message: 789

Using UI-View as a Digi: 2 Comments.

1) If you are using UI-View as a Digipeater and are digi'n WIDEn-N, this might be of interest.

This comments were extracted from: "Fixing the 144.39 APRS Network" (WIDEn-N FLOODING FIREWALLS: The most important thing is that ALL digis everywhere should act like firewalls to inappropriate values of N. This is easily done by using the MYALIAS or UIDIG-LIST which take priority over the n-N processes. By putting WIDE4-4, WIDE5-5, WIDE6-6 and WIDE7-7 in these alias lists, these packets will be digipeated once, but will not be further propogated. Users must get the message that N's above 3 in most areas will not be digipeated further than one hop.)

There are some that insist in using execive N-n paths. So using the "Firewall " or "Trapping" their abuse will benefit all.

In UI-View I have tried the "trapping", and found it to work reliablely.

To use the "Trapping" you must enter a string of text in the Digi Set-up Alias box. The text must consist of the paths you wish to "trap".
To "trap" paths greater than WIDE3-3, you would need to enter the folowing text in the digi alias box behind "your call" and "WIDE", and/or "RELAY", if you have them in your alias box:
WIDE4-4,WIDE4-3,WIDE4-2,WIDE5-5,WIDE5-4,WIDE5-3,WIDE5-2,WIDE6-6,WIDE6-5,WIDE6-4,WIDE6-3,WIDE6-2

This will "trap" stations with WIDEn-N's of 4-4 to 6-6. Of course you can go higher if needed. There is no need to list Wide N-1's into the list, because it is only going out from your station and no farther. Just as the "traped" stations will only go out from your station and no farther. And yes that long list will fit into UI-View's Digi Alias box.

Note: This "TRAPING" method is something I have read somewhere, but, I do not remember where.(It is NOT my idea.)

2) Fill in Digi (Home Digi's)
If you have your home digi set up as RELAY (to assist mobiles in your area to hit the Big Digi's) Do you have WIDE1-1 listed there also. In phasing out RELAY, WIDE1-1 took it's place , so some out of area mobiles might be using WIDE1-1.
Although currently most of our Big Digi's do not support WIDEn-N packets yet, your station digi'n them out my get them to an I-Net

Gate, or even to Digi that supports WIDEn-N. This is just something to think about. For not all stations are located in area's where this might be possiable

Subject: Preliminary Flight Info
From: "Mike Coffey" <mike@...>
Date: Sat, October 22, 2005 6:24 pm
To: chat@...

Hello all,

What a great flight! I've got the media we recovered from the video camera posted online at http://sunsite.utk.edu/~mcoffey/ux-3/video/ if you want to take a look, but I recommend you have broadband! It's not processed yet. Here are the files:

CLIP0009.ASF CLIP0022.ASF PICT0004.JPG PICT0020.JPG PICT0029.JPG
CLIP0010.ASF CLIP0032.ASF PICT0005.JPG PICT0021.JPG PICT0030.JPG
CLIP0012.ASF CLIP0035.ASF PICT0006.JPG PICT0023.JPG PICT0031.JPG
CLIP0013.ASF CLIP0038.ASF PICT0007.JPG PICT0024.JPG PICT0033.JPG
CLIP0015.ASF CLIP0039.ASF PICT0008.JPG PICT0025.JPG PICT0034.JPG
CLIP0016.ASF PICT0001.JPG PICT0011.JPG PICT0026.JPG PICT0036.JPG
CLIP0017.ASF PICT0002.JPG PICT0014.JPG PICT0027.JPG PICT0037.JPG
CLIP0018.JPG PICT0003.JPG PICT0019.JPG PICT0028.JPG

I especially recommend CLIP0016.ASF. There was a glitch around 100,000 feet which resulted in the 2-meter and 10-meter radios being permanently keyed for the duration of the flight, and voice telemetry ended at the same time. Additionally, no onboard telemetry was recorded past that point. The video camera recorded some still photos, and we weren't expecting that. There has been some speculation that the 2-meter caused the video camera to go into an undesired mode, and activated the camera flash. We are wondering if that triggered a corona discharge that caused the systems mentioned to fail. Further details as the post-mortem continues.

I am endeavoring to get the still images from the downward-facing cameras onto the website. We are missing a necessary cable.

Thanks,
Mike

791. UX-3 Logs Needed

Yahoo group: EastTNAPRS
Date: 2005-10-24 17:52:58 UTC
From: Travis J. Maclay
Topic: 791 Message: 791

As some or most of you may know, the UX-3 balloon mission this past Saturday made a few entries into the record books. The first entry is a #2 rank for altitude for 2005. The second entry is #9 all-time rank for altitude. These are great accomplishments, being only the 3rd mission for UTARC.

The highest altitude we have right now is 35,211.7 meters (115,523.95 feet). However, it appears from all of my logs that a packet is missing right after this packet. We have a 50% chance that if anyone has that packet, it could include a higher altitude. The packet in question will start with $GPGGA and will be timestamped 14:04:28.

If you have logs, please check them and send anything potentially helpful to me at tjmaclay@...

Thanks so much for everyone that came out and participated!

Travis Maclay

We need the entire $GPGGA record which we believe will also?have a 35337.0 in it for height.? We would like to have several records before and after this GGA sentence for the records.? Actually, if you've got this missing record, just give us a copy of your entire APRS log for this flight.? Thanks

Here is my log file from 145.600 Mhz.

There is some data from 144.390 Mhz early in the day. This was to make sure
my equipment
was working. All of the K4T-11 data is from 145.600 Mhz

At 10:04AM 21.9 Miles 115632 feet I think there is two packets
in the log at 21.9 Miles

David did you not get the log file I attached?

There is two entries at 10:04:06AM and 10:04:28 AM that show the highest altitude.
in the log file. 21.9 Miles Ui-View displays miles above 100,000 feet.

Not quite, your high only shows 114, 415.682 feet.? See, you are missing the GGA in the middle of those two RMC's as well.? Just like the rest of us.

799. Digi in Johnson City ?

Yahoo group: EastTNAPRS
Date: 2005-10-24 21:10:03 UTC
From: William McKeehan
Topic: 799 Message: 799

Given the coverage that I saw during the balloon chase on Saturday, it looks like a digi in Johnson City would be a good addition to the APRS coverage in East TN. It would be really nice if it was high enough to cover Johnson City and down to Greenville; maybe something on Buffalo Mountain or somewhere.

Anyone know anyone up in that area that may be interested in getting involved in APRS and putting up a digi in that area?

William, There was a digi in that area and they just lost their site. I'm sure they are working on it.

Was that W4FXO-3? It looks like that digi is operational up near Bristol (Blountville?).

David's photos have some good pictures from the final assembly of the balloon and payload prior to launch. You can see the parachute and how it's connected to the payload and a bunch of other things.

804. Antenna Question

Yahoo group: EastTNAPRS
Date: 2005-10-25 14:47:50 UTC
From: William McKeehan
Topic: 804 Message: 804

I'm considering an antenna to use with my D700. Currently, I have a simple 1/4 wave antenna which works for both 2 m and 70 cm. I would like to get something with better performance. I have tried a 5/8 wave 2 m antenna and like the improvement that I see with that antenna, but that antenna does not work for 70 cm.

Can anyone recommend an antenna that would give me the improved performance on 2 m (over the 1/4 wave) while also being a dual-band antenna?

Thanks!

There is also this one: ARX270 DUAL BAND RINGO 70CM / 2 METER
The Cushcraft ARX-270 is a high performance fiberglass antenna for 2 meters and 440 MHz. It provides 9 dBi on VHF and 12 dB on UHF. Three section design. UHF [SO239] connector.

809. Setup on Motorcycle

Yahoo group: EastTNAPRS
Date: 2005-10-25 15:20:31 UTC
From: William McKeehan
Topic: 809 Message: 809

It seems like today is my day for antenna questions...

I have a tracker setup (KI4HDU-9) that I use when I don't want to lug the D700 around. This setup is a TinyTrak 3 with my Yaesu VX-5R.

I am using a "window mount" to get a better position for the antenna; this window mount is the type that you roll the window down, attach the mount, then roll the window up to hold it in place.

The antenna that I am using is a Comet CH75. It's 390mm long (approx 15 inches).

When I use this setup on my Motorcycle, I get poor results. I have the window mount attached to the front windshield of the motorcycle in such a way that the antenna is basically vertical.

Using the same setup (equipment, wiring, etc) in a car, the tracker performs reasonably well. Does anyone have any ideas why I'm seeing such poor performance on the motorcycle?

I had this setup on the Motorcycle Sunday when I rode; we took a trip over to HotSprings, NC, then over to Maggie Vally, Cherokee and back thru Gatlinburg/Pigeon Forge. At some point, the GPS cable became disconnected, but I confirmed that it was running on the route to Hot Springs, but I only got a few packets within a few miles of my house and nothing more during the day.

Suggestions for improvement?

My guess for poor performance would be the lack of a good ground plain.? The car seems to be giving that and the bike is not.

From: William McKeehan
Topic: 804 Message: 811

I guess I should have mentioned that I'm primarily concerned with mobile operations - a 16 ft antenna would be a bit much for my ride :-)

But the 9dBi gain sure would be nice!

The 5/8 wave gives a 3dBd/5.2 dBi gain on 2 m, so the multi-band with 1.6 dBd
is about 1/2 the performance, correct?

It would still be better than my 1/4 wave.

Sounds like a reasonable guess to me. Would connecting the ground of the antenna to the motorcycle frame to give me a better ground plain?

The antenna uses a BNC connection, would it simply be a matter of attaching a wire between the frame and the outer ring of the BNC connector do what I'm talking about?

I'm referring to ground radials protruding out from the base of the antenna.? Not pratical for a bike though, but would surely help.?

Is the 19" something that should be tuned like the length of the antenna or is that a minimum?

If it's a minimum, would it improve my signal to connect that wire to the frame of the motorcycle?

I would not electrically connect the bottom end of the pig-tale to the bike frame.? The only electrical connection I would make is at the base of the antenna on the ground side.? The 19" is ? a wavelength on 2 meters.? That is ideal but I would say that it?is not the minimum.? Anything less though may effect performance.? These are my opinions and are not necessarily accurate.?

Lakeway (the Hamstick folks) sells a 5/8 wave no ground antenna that
might be good.

821. KF4CFO-7 "Tweaks"

Yahoo group: EastTNAPRS
Date: 2005-10-27 02:27:28 UTC
From: Scott
Topic: 821 Message: 821

Today, I did some "tweaks" to the ini files and digi paths on KF4CFO-7. It now responds to KF4CFO-7, RELAY, WIDE, WIDEn-n, TN, and TNn-n, and also exercises path trapping above 3-3.

Feedback is welcome.

Scott NA4IT

From: Kevin R. Colvin
Topic: 821 Message: 823

Moe,
By using the "TRAP" , these packets will be digipeated once, but will not be further propogated. So if you hear KF4CFO-7 direct and you have been seeing that 6-3 station, you will continue seeing him, but if he was being digi'd from CFO-7 to lets say, WA4BDS who didn't hear him direct, then now it should cease.

So now you should no longer see CFO-7 digi'n out packets with N-n's looking like this:
KF4CFO-7*,WIDE6-3*,, now they will look like this KF4CFO-7*,WIDE6*
but this dose no stop those determined to go exesive paths, example:
KD4QIA>APR846,W4LAW-3*,KF4CFO-7*,WIDE3*,WIDE,WIDE,WIDE2-2
This looks like a WIDE,WIDE3-3,WIDE,WIDE,WIDE2-2
KEVIN / KF4YMC

The guy in Atlanta that runs WIDE6-6 shouldn't even make it past his local area.? But if he does, by the time it gets up here, the number of the suffix willbe smaller and therefore slides through everybody's digi.? So to your statement, that a yes and/or no.? What Scott settings will do is filter the guy who runs WIDE6-6 at the source and keep it from getting out on the network.? All the other digi's should work with him and also filter these 6-6 out.? Does that help?

Sounds like great stuff Scott. It's good to hear you back on the list.

I've always been a fan of supporting both the old style paths (RELAY,WIDE) and the new stuff (WIDEn-N) until all of our digi's support the WIDEn-N. So I'm glad to see what you have done.

I've also heard/seen that some other stations are becomming active on APRS in your area - in part due to your help. I'm glad to see more statioins active in that area.

I have not been watching KF4CFO-7's traffic, because I can't hear him direct, so it's hard for me to tell what he hears/digi's. I see that he can hit WA4KJH-7 and W4YYM. Does it provide the coverage that you wanted it to provide? What areas does it cover?

From: Scott
Topic: 821 Message: 826

I think KF4CFO-7 is providing the right amount of coverage, as long as everyone else around here locally doesn't do anything greater that RELAY and WIDE1-1 in their home or mobile digis. Kevin, KF4YMC has also been a big help to a lot of the new guys, has done a lot of research on path, digiing, trapping, and done a huge amount of trial and error work to see what will work and what will make the APRS system in E TN better. It is priviledge for the MCARC to be able to provide KF4CFO-7, and we owe a great debt of thanks to Athens City Hall and Athens PD for funding, equipment, shack, and tower space.

Just a comment about the trapping greater than WIDE3-3:

If a station does have WIDE6-6 in his path, that means (as far as I understand) he is asking for 6 hops (wides) with a countdown. With the traps set up, if such a station has only done 2 hops before KF4CFO-7, then it will do one more WIDE. If station has already done 3 hops before KF4CFO-7, the KF4CFO-7 ignores the request. I'm like Moe, someone in Atlanta does not need to do WIDE 6-6, because some igate along the line will pick him up anyway, and put him into the system that way.

I could imagine that a Kansas flat-lander might want WIDE6-6 to get across the state, but here in TN it ain't happenening anyway.

I'm glad to see some more folks using APRS. As you all know, my main use of APRS is the Skywarm aspect, but some of the guys are going to use it all the time, be it via RF or Internet. I am working with one of our newer hams who is retired and does some traveling. He has bought a TMD700A, has a GPS and laptop, and we are working toward getting him setup.

Just for some drool material: one of our local hams served in the Gulf Coast area. Another ham he worked with had the following setup MOBILE!

TS-2000 on the floor console on HF, TMD700A in the overhead console doing APRS or cross-band repeat, and the TH-D7AG HT on his belt. He really impressed the Red Cross folks when he picked up the HT, hit a few keys, and talked from MS to TX.... Oh yea, he had some kind of HIGH dollar screwdriver antenna for HF that was REMOTELY controlled by the TS-2000!

828. New to the list/APRS/UI-View

Yahoo group: EastTNAPRS
Date: 2005-10-27 17:08:19 UTC
From: k4hsm@knology.net
Topic: 828 Message: 828

Hello. I just got started on APRS last month, and have been using UI-View and have enjoyed it. I'll apologize to anyone who may have been receiving too many beacons from my station, as I'm still learning (been told I'm sending out too much :)) - but at least I was able to utilize APRS to get a couple hundred more feet out of UX-3 last Saturday...

Anyway, I'm still not familiar with a lot of the commands, but am trying to read up on them. For instance, the WIDE6-6 type of commands or the TN commands. Is this supported in UI-View, and should I use them, or attempt to? What's the advantage of these type of commands? More importantly, what commands can I send out to pull in stations on my view without sending out too much traffic on the digis?

I also notice little or no station info coming from Chattanooga, Tri-Cities, or Nashville over the air (just started getting TCP/IP data last weekend) and was wondering are they using a different frequency, protocol, or is there just no activity in those areas? How can I at least attempt to see who's listening in those areas? I heard talk of a statewide APRS network for emergency traffic but have no idea how to bring up stations over the plateau or in the NE corner of the state. I can provide some kind of service as I have a beam that can reach repeaters in these cities, even SE KY, but not sure if there are stations listening, or if they're elsewhere on the band.

Thanks in advance.
Greg Williams

From: William McKeehan
Topic: 829 Message: 829

For those of you with lots of money (i.e., don't look for one of these in my car the next time you see me, but if you want to give me a Christmas present, I would love to have one), here's a new GPS (not yet available) that would be perfect with a D7 or D700 and would basically eliminate the need for a laptop.

From: Kevin R. Colvin
Topic: 828 Message: 830

Greg,
As far as sending out too many beacons, I do not know, but I choose at randon a date from my logs and looked at four hours, midnight to 4:00AM Here's what I saw.
I notice you were sending out an object, so that accounts for some of your txms. I see a pos beacon every 30 minutes, I see no problem with that. And I see a status beacon. So far I don't see anything that I would gripe about, myself.
You path settings are good, not to many hops.

Now, should you use WIDE6-6...NO! and again NO!. . I think 99.9% of everyone around here will agree with me on this.
WIDE 3-3, in my opinion is the largest WIDEn-N that should be used, and that is if you are located where you can not access a BIG Digi.,Or for special, regional wide events/activities that would require large coverage areas.
TN and TNn-N are special use paths. I will not go into the useage, for the opionions vary widely.

As far as sending out something to PULL IN MORE STATIONS. I don't think it can be done.

As far as seeing distant stations all the time. That depends on a lot of factors. but the best sudgestion I would give someone is. Put your antenna on a tower as high as you can and on a tall hill. Thats why all Big Digi's around here are on Tall Hills, to get the coverage, TXM as well as RCV.

We also have another problem. Locally we use WIDE and RELAY, where other areas use WIDEn-N. That means that if our local digi hears a WIDEn-N it will not be send it out, so there is another reason you don't hear as much... And yes the proper people are aware and working on the Digi Problem, if you would call it a problem.

As far as the Statewide Emergency network, I'll keep quite on that one, because I know nothing (no true facts) about it.

Keep on asking questions, we all have answers, even though mine are normally wrong.. so come on guys, correct my misguided statements and fill in the blanks.

Kevin / KF4YMC

I don't suffer from insanity; I enjoy every minute of it.

Subject: [EastTNAPRS] New to the list/APRS/UI-View

Hello. I just got started on APRS last month, and have been using UI-View
and have enjoyed it. I'll apologize to anyone who may have been receiving
too many beacons from my station, as I'm still learning (been told I'm

sending out too much :)) - but at least I was able to utilize APRS to get a couple hundred more feet out of UX-3 last Saturday...

Anyway, I'm still not familiar with a lot of the commands, but am trying to read up on them. For instance, the WIDE6-6 type of commands or the TN commands. Is this supported in UI-View, and should I use them, or attempt to? What's the advantage of these type of commands? More importantly, what commands can I send out to pull in stations on my view without sending out too much traffic on the digis?

I also notice little or no station info coming from Chattanooga, Tri-Cities, or Nashville over the air (just started getting TCP/IP data last weekend) and was wondering are they using a different frequency, protocol, or is there just no activity in those areas? How can I at least attempt to see who's listening in those areas? I heard talk of a statewide APRS network for emergency traffic but have no idea how to bring up stations over the plateau or in the NE corner of the state. I can provide some kind of service as I have a beam that can reach repeaters in these cities, even SE KY, but not sure if there are stations listening, or if they're elsewhere on the band.

Thanks in advance.

> a problem.

I 100% agree with everything Kevin has said above. I would add that for each
hop that packets travel, the potential for collisions increases, so the
ability to get packets to travel multiple hops (and thus cover long distances)
is not easy.

>

About 1.6 db..... dBd is using a 1/4 wave Dipole hanging in free space. DBi uses an theoretical Isotropic dipole as it's reference. The DBi is a marketing tool used to increase the db numbers to make the antenna look better. Only trust a db-d reference, those are actually measured. db-i is just a calculation.

From: John Moyers
Topic: 809 Message: 834

William, may I first ask what type of Motorcycle?? Does it have a hard Trunk? If not, does it have hard saddle bags?

On the subject of connecting the antenna ground to the bike, I'd only recommend that if the antenna is close (1" or less) to a vertical piece of frame that is at least 18 inches in length on the same plane. Doing the ground connection at the radio/coax connection will not help in this case.

I also think you said the antenna is 15 inches long?? That's a might short for a 146 MHz 1/4 wave antenna. It should work pretty good though in the Public Safety band of 150 - 160 MHz. Most 2M 1/4 waves I have worked with have always been around 18.5 inches.

The last time I ran a 2m antenna on a bike I used a 1/4 wave mag mount wedged between the rear of the seat and the brake light. The mag mount sat on the rear fender and worked with the capacitive ground as mag mounts are designed to do.

When doing antenna's on police motorcycles, the antenna is mounted on to the top of the trunk that houses the mobile radio. The trunk lid has a metallic plate in it that runs it's full length and width. Then a ground wire ties this plate to the chassis. When the antenna is mounted in the center of the trunk lid, this plate serves as it's ground plane.

This is why I have asked if you have a hard trunk. If so, then you can line the inside of the trunk lid with copper foil and mount a 1/4 wave NMO mount antenna in the center of the lid. (Of course you do not want any Chrome bars on top of the trunk lid since they will react with the antenna.) Since you are using an HT on it's own battery and not connected to the bike for any power you should not have to ground the copper foil to the bike chassis.

If the trunk has chrome rails on top then you can use those as the ground plane just make a mount for the antenna that attaches to them. The same can be done is you only have a luggage rack behind the sissy bar.

Regardless on any of the above. Antennas have to have a ground in order to work. It can be a ground plane or it can even be a counter-poise (this is the ground wire that was mentioned being added to shield at the base of the antenna you are currently using), but a driven element of any dipole must have it's counter part if you want it to work efficiently. The ground has to start close to the insertion point of the rf.

Subject: Re: [EastTNAPRS] Setup on Motorcycle

Sounds like a reasonable guess to me. Would connecting the ground of the antenna to the motorcycle frame to give me a better ground plain?

The antenna uses a BNC connection, would it simply be a matter of attaching a
wire between the frame and the outer ring of the BNC connector do what I'm talking about?

Specifically, it's currently a 1983 Yamaha Venture Royal. Full trunk, saddle bags (hard), front fairing and windshield.

I do have crome bars on top of the trunk - so either remove the crome bars or make a mount to go on top of them. I like the idea of making a mount to attach to the bars...just a flat piece of metal (I assume bigger is better) with a NMO mount in the middle?

I wish!

There are some unanswered questions about the unit, but it sounds like it's going to be a great unit. With the D700 attached, you will be able to see stations on the screen and will be able to ask it to give you driving directions to the station selected! Should make chasing a balloon super easy!

And the screen is pretty big - 5" screen I think it said, so that's much better than most GPS units (certainly better than my non-mapping Garmin GPS II+).

If I had the money (remember, I currently own only 3 radios - two are HTs), I'd have one attached to my D700; actually, if I had the money I'd have a Garmin GPS 276c - about the same (slightly smaller screen), and already on the market. I looked at one this spring at the Bass Pro shop in Memphis...but was unwilling/unable to part with $700 to get one.

838. GPS for Mobile use

Yahoo group: EastTNAPRS
Date: 2005-10-28 13:36:18 UTC
From: Scott
Topic: 838 Message: 838

Hey guys,

If you need a cheap GPS with no screen, that operates on 12V, has an external antenna, take a look at this link...

http://search.ebay.com/_W0QQsassZy55mph

I'm not promoting this guy's sales, but Larry, K5BXV sent me info about these. These were originally $1300 units. This guy buys them surplus (sometimes NEW surplus), and flashes the EPROM to do NMEA 4800 baud to BOTH ports (yep, has '2' serial ports!).

Even though I don't run APRS mobile, for future use, I'm thinking seriously about robbing the wife's piggy bank....

From: Scott
Topic: 839 Message: 839

Guys, I am seeking input here.

The TMD700A setup I am working on, the guy who owns it has a Palm w/ built in GPS and maps.

Anyone know if it could be interfaced to the TMD700A, not as a "controller" but as a GPS that would show stations on it's maps?

Sure would be a neat deal if it did...

From: William McKeehan
Topic: 839 Message: 840

If the Palm can output NMEA via an RS-232 then yes, it should be able to feed the D700. What palm specifically does he have?

Moe, Your correct as it goes for a fire truck. Fire truck is powering the radio. In the discussion of the motorcycle William is using a HT powered by it own self contained battery. Therefor you only need a large enough metalic surface below it to function as it's counter-poise. Also please note that this was my last choice of mounting positions.

As for Fire trucks I only mount antenna's on them on the Roof of the Cab. Rule #1, highest location and large flat surface. When you don't have that you have to be creative.

Subject: Re: [EastTNAPRS] Setup on Motorcycle

I have dumb question...

The chrome rails work as a ground?

We had a major problem with this when I was a Volunteer Fire Fighter.... the Motorola tech mounted the antenna to this... it was worthless... we could not "talk across the road". I mentioned this to John (W3GJF-SK) he suggested changing the location or running a flat brad to the "ground" side of the antenna mount...heck it was like adding a amp and a 1000' tower to the radio it made such a difference....

John claimed the chrome was worthless... for a ground plane...

Just my experience.... I like your idea on the plate if he can mount it in it...

That looks like an interesting antenna...and their web site says it is specifically for Boats, Motorcycles and other things with little or no ground plane.

This has moved up high on my list of things to try!

Thanks for telling me about it.

One has to wonder why they were originally $1300...I wonder if they are very rugged or something.

The two outputs would be nice at times...one to feed the APRS machine and one to feed somethig else (I like the ability to use some other software on my laptop).

844. Re: [EastTNAPRS] Setup on Motorcycle

Yahoo group: EastTNAPRS
Date: 2005-10-28 15:13:55 UTC
From: John Moyers
Topic: 809 Message: 844

This sound interesting. I would have to see the bike. I can't make my mind up on what my first choice would be here. Don't know whether I would fashion a plate over the top of the Rails on the trunk or remove them and mount it to the trunk lid. There is a safety factor here that I would want to think about. Something about a flat horizontal plane traveling along at a high velocity in the same direction as a rider with said plane about mid level back. As long as everything goes to plan life would be good. However, should the rider dump the bike then the rider and the above mentioned plane are no longer traveling at the same velocity and possibly the same direction. Depending on the difference in velocity this plane (Ground Plane) COULD become either a nasty scraping device (something the Indians used to prep hides) or a seriously large knife.

Would defiantly want to see the bike first.

I have mixed emotions on using no-ground antennas. They work, but not nearly as well as one with a ground plane. However, in some applications they are the best tool for the job.

William, This has been a fun line of discussion. I have been thinking in the back of my head about how I was going to mount an antenna on my current bike. It's a Kawasaki 1500 Vulcan. Windshield, leather saddle bags, and a very dirty electrical system when the V-twin is running. When I put the Hyper-lights on it to flash when the brakes come on, I ended up putting a 10,000 mfd filter cap in the brake light circuit just to clean it up enough to get the Hyper-Light control circuit to work enough to suit me. (yes, I've been rear-ended on a motorcycle in the past and I want everything I can get to wake the 4 wheeled vehicle behind me up to fact that I am there and they need to pay attention. You can only carry so many objects that can be thrown.....<G>)

So having an HT on it's own supply is probably how I will go motorcycle mobile. Since I haven't put a sissy bar and luggage rack on the bike yet, I have some time to do a little planning and thinking about the antenna. I am thinking about using a Freelinc wireless headset to the radio. http://www.freelinc.com/ Since I also ride with a full face helmet, this should work pretty well. Although the PTT is an issue I'm working on, I don't think VOX and motorcycle riding around Knoxville or Sevierville would be a real good mix.

Now to keep this APRS related I will bounce an idea. Since William is already running an HT, he could take a PICO TNC, a small GPS, and a battery pack mounted in a backpack and hooked to the HT. Then he needs to get a Steel Pot Helmet and mount a short rubber duck antenna in the top of it, you know the Prussian Helmet look. Run the coax down his back and under his leather jacket to the HT on his belt. Doing this we could all track his every move..... Sounds like something I saw years ago the Dayton Hamvention.....

I do have crome bars on top of the trunk - so either remove the crome bars or make a mount to go on top of them. I like the idea of making a mount to attach to the bars...just a flat piece of metal (I assume bigger is better) with a NMO mount in the middle?

From: William McKeehan
Topic: 809 Message: 845

I currently use the AudioBoss AB-1M from MotoComm.
https://www.rflimited.com/ShowProduct.asp?productID=26&NodeID=c2

It's an inexpensive system that is very portable (my brother has his in a tank bag). It allows rider/passenger full-duplex intercom; PTT interface with a number of 2-way radios (CB, FRS, HAM, whatever has standard connections) and it allows the input of a Cell phone, Radar dector and MP3 Player - all at the same time! It's nice to be rolling down the road and answer your cell phone :-)

It's not great at high speeds, but at speeds below 60, it works very well, especially considering the price.

As for the motorcycle, there are a few pictures of it here:
http://mckeehan.homeip.net/motorcycle/index.htm

I'm thinking about getting a TH-D7 so I can do both APRS and voice with one radio.

I'm also planning to get a new bike early next spring (either a new Yamaha Royal Star Venture or a HD Electra Glide Ultra Classic), so I may just wait until I get the new bike to make dramatic improvements to the antenna system.

When I read your comments earlier about the fire truck and mouting the antenna high, I was thinking about the helment...that would certainly get people talking :->

Topic: 809 Message: 846

Interesting product, I've been looking for something like this. Now to do some research and figure out where to use this on the bike. I dislike tank bags, but I may make an exception for something like this.

Also the photo's of your bike helped. Do you really like putting things on the luggage bars above the trunk?? Or, could you for go using them when you wanted 2m on the bike?

After looking at the shape and size of the luggage rack you might be able to make a small mounting bracket and put it in the center of the rack. Then mount a bnc bulkhead connector and use a long KULDUK 2m rubber duck antenna. We are suggesting a rubber duck for safety reasons. You may end up needing to ground the rack to the chassis for optimum results. This is easy to test without doing a lot damaging work on the bike.

If you have a magnetic mount 2m antenna, set it on the rack with the element centered on the rack and directly over one of the bars. Then do some RF testing. If you can, check the SWR and then do some on air comparisons between this antenna and the one you normally use. You may also want to take a test lead (jumper lead) and temporarily run a ground from the rack to the chassis of the bike and see if that changes anything. Don't worry about noise in the bikes electrical system. We are talking FM not AM RF from an isolated HT.

If the Mag Mount works better than your current setup then you can take a small piece of aluminum to mount the BNC connector on and attach it to the center of the rack. When you need to use the rack and not the antenna you can take the antenna off very easily.

OUCH, That does make mounting an antenna fun. I'll bet there was a temptation to mount it horizontal, but that's about a 15 db loss of signal in a vertically polarized world. You know if the Truck had a covered hose reel, that would have made a real good mounting location. It's a pain to do, but it works pretty well.

Wait a second..... What do you have as a light bar on the top and how tall is it??

HI John,

That is true... the reason we had the antenna so low was we had a low hanging roof.... the truck could only be backed in IF it was loaded and the springs compressed... long story.... we built the building before we had the truck... the VFD we purchased the truck from measured it full.... then gave us the measurements... we added 6 inches.... thank goodness or we would have slight problem.. :)

73, Moe N4CQW

On 10/28/05, John Moyers <moyers@...> wrote:

Moe, Your correct as it goes for a fire truck. Fire truck is powering the radio. In the discussion of the motorcycle William is using a HT powered by

it own self contained battery. Therefor you only need a large enough metalic surface below it to function as it's counter-poise. Also please note that this was my last choice of mounting positions.

As for Fire trucks I only mount antenna's on them on the Roof of the Cab. Rule #1, highest location and large flat surface. When you don't have that you have to be creative.

EastTNAPRS@yahoogroups.com writes:

Subject: DeLorme Earthmate GPS Lt-20

OK guy's I am about to go nuts trying to configure UI-View32 to work
mobile... what the heck I am I doing wrong!

I have a Earthmate GPS on a USB connector... told UI-View what the GPS
was... no luck.... reconfigured the com port(s) and did the utlity update

I have proof the GPS works using the Street Atlas 2006 program so I know
that much about it... it works...

Does anyone have one of these in operation on APRS? I would assume there are
a bunch out there considering the UI-View program has a check box for it...

Also just another dunb question to ask... how in the heck do you tell
UI-View your a mobile staion? Does it switch to mobile when you start
inputing GPS data that is valid?

Thanks for all your help and understanding if the next time you see me I am
bald from pulling my hair out!

Don't check the checkbox for Earthmate. Use it with the Delorme Serial Port
Emulator and tell the program which port it is coming in on. You must start
the GPS through the port emulator. Make sure the "shared port" is disabled
in GPS setup if you have been using it with a Kenwood.

I have an ammo box lying around not being used. Was planning to use it for
a portable unit but never got a round tuit.

Subject: [EastTNAPRS] Digi in a box ?

Has anyone here built a "digi in a box"? i.e., something like an ammo box
with
a radio/tnc/antenna that could be put out in the woods (or up a tree) for an
event.

If so, I'd like to see some pictures.

William,

I have one in the garage. What should I do with it, however?

Travis

Bill I asked Jim and I will ask you also do you know anyone who is using a PK88 or a PK12 TNC, I lost the book to it and that was some 12 years ago now I need all of the commands and there meanings. Are you able to help in this matter, and do you need a copy of a map program as I have 5 different ones ?

I'm kinda in the same boat.

In talking about the tracker/antenna on the motorcycle, I thought that a portable tracker attacked to the trunk of the motorcycle may be the easiest solution.

I had hoped to find some pictures from someone who has done something similar, so I can copy :-)

William, Just a thought,
5 watt out put on APRS is ok if one is close to a digi and conditions are good, but more power out would be better. And if one is using the radio battery pack for power, a more stable power sourse might be prefered. So with saying that, If a Docking Booster was used with a HT it would give the HT a more stable power sourse and also boost power out. But one must be carefull of RF exposure if placed on a Motorcycle. Some Docking Boosters will give your up to 50w output.
Just a thought...

FWIW, I would never recommend more than 5 or 7 Watts on a bike. Although if there is not a passenger on board and the antenna is on the rear of the bike you could probably get away with 15 or 20 watts safely. Of course don't tell any of this to those who climb AM broadcast towers on 24 hour stations, climb any other tower with several operational 100 watt repeaters on it, or for that matter stand near my work vehicle when I'm transmitting.

That said, 5 watts is more than enough depending on what your wanting to do and where you intend to do it. Your digital cell phone is less than a watt. Guys this is why Relay was part of the original paths in APRS and why most digi's had Relay in their alias list, and why it was encouraged for everyone to use Relay in their stations (including mobiles). It allowed the low power stations to propagate across the network. It also allowed for low power stations to be rapidly deployed during a disaster with a system that was already configured to handle them. The trick was that the individual operators were not to use RELAY in their beacon paths unless they were mobile or using an HT and needed to use RELAY.

In a disaster, a 5W portable station located on top of a hill, connected to an portable antenna 10, 20, or 30 feet up a tree can be very helpful. Especially if it is covering an area with limited or no coverage and only needs to relay to a digi that is now in line of sight coverage with the 5 watt portable digi. This is the same principle we use in Public Safety with vehicular crossband voice repeaters. They are nothing more than an HT running about 500 mW linked into the 50W or 100W mobile so that our HT's can talk back to dispatch via the mobile radio.

Using the setup like William is discussing, I can take an ammo can (or a small pelican case) mount a 5 W HT without it's battery, a small Paccom HandyPacket or PicoPacket TNC, a good sized gell cell battery and get 8 hours of operational time from it. On top mount a rubber duck antenna to a BNC connector and add a DB-9 connector for data. With this setup, I have a rapid deployable APRS Tracker, an emergency fill in digi, or a portable APRS station if needed in a field deployable situation. All I have to do is connect a laptop or GPS to the DB-9 to setup and control the TNC, and decide if I want to use the rubber duck antenna or a run of coax to another antenna on top of a building, up a tree, and any where else I can find to put one.

If you need more power just bring a BIG deep cycle battery and a mobile amplifier to connect to the BNC connector. I already know of one such device that was built several years ago and has been used on many occasions over the years. I just don't think WO4U is on this list.

>I would never recommend more than 5 or 7 Watts on a bike

THAT IS WHY I MENTIONED RF EXPOSURE. (RADIO POWER OUT PLUS ANTENNA GAIN FACTOR)
A RADIO ON 145.146MHz AT 10W WITH A 1dB ANTENNA =CONTROLED DISTANCE OF 1.7FT
A RADIO ON 145.146MHz AT 50W WITH A 1dB ANTENNA - CONTROLED DISTANCE OF 3.7FT

>That said, 5 watts is more than enough depending on what your wanting to do and where you intend to do it. >Your digital cell phone is less than a watt.

5 WATTS MY BE GREAT IF YOU LIVE IN DC.
CELL TOWERS ARE SCATTERED EVERYWHERE. I CAN SEE 8 JUST FROM MY HOUSE. I CAN'T SEE ANY DIGI'S STATIONS. .

>Guys this is why Relay was part of the original paths in APRS and why most digi's had Relay in their alias list, >and why it was encouraged for everyone to use Relay in their stations (including mobiles). It allowed the low >power stations to propagate across the network. THE PROPER USE OF RELAY AS YOU STATED IS A MUST. BUT I STILL SEE HOME STATIONS USING RELAY IN THEIR BEACON PATH AND WHEN I GET THEM DIRECT, WELL I WOULD THINK THEY ARE USING A LITTLE MORE THAN 5 WATTS.

ONE MUST REMEMBER, THE FARTHER YOU GET OUT OF THE CITIES OR POPULATED AREAS, 5 WATTS IS USELESS, JUST LIKE CELL PHONES HAVE MAJOR DEAD SPOTS. AND WE MUST REMEMBER HOW MUCH TRAFFIC THE BIG DIGI HEARS. IT'S A LOT HIGHER THAN ANY OF US COULD EVER GET OUR ANTENNAS.
AS YOU SAID, IT ALL DEPENDS ON WHAT A PERSONS OPJECTIVES ARE, AND WHERE THEIR ARE GOING TO TRAVEL. I HAVE SEEN 5 WATT HT'S IN MOBILES WITH EXTERNAL ANTENNAS WORK FINE IN AREAS AND SEEN THEM USELESS IN OTHER AREA.. HAVING THE ABILITY TO HAVE MORE POWER INCREASES THE PROBALITY OF BEING HEARD.

AND JUST AS AN EXPERMENT, I AM GOING TO DROP MY HOME STATION TO 5 WATTS, CHANGE THE PATH TO RELAY,WIDE ON 1 BEACON, AND WIDE1-1,WIDE2-1 ON THE OTHER BEACON. MIND YOU MY ANTENNA (OMNI) IS 30 FT ABOVE GROUND (APPX 1200'ASL) , ON A HILL, SO MY HAAT SHOULD BE MIN. OF 20 FT. AT LEAST IF NOT HIGHER. WITH KF4CFO-7 ONLY 8.9 MILES AWAY, I SHOULD BE ABLE TO HIT IT. HOPEFULLY THIS WILL LET ME SEE HOW WELL 5 WATTS DOSE IN NECK OF THE WOODS. I AM THE TYPE OF PERSON THAT THINKS 5 WATT HT's ARE GOOD FOR SOME THINGS BUT FOR ANY TYPE OF DIGITAL USE, UNLESS YOUR REAL CLOSE TO WHERE YOUR SENDING YOUR SIGNAL.

JUST REMEMBER, THESE IS MY THOUGHTS, I AM NOT NEARLY ENOUGH EDUCATED ON THE SUBJECT. AND THRU THIS GROUP AND PEOPLE LIKE JOHN, THAT HAVE BEEN AROUND A WHILE, HOPEFULLY I WILL LEARN A LOT MORE.

KEVIN / KF4YMC

Kevin,

Yes in theory the distance is correct. I remember when RF exposure became an interest of the FCC. I remember when they issued a request for any information from any one in the RF industry (commercial or ham) who had experienced a medical problem attributable to RF Exposure. To date, I don't recall anyone who reported a medical condition that was medically linked to exposure of any RF outside the microwave bands. Now there are certain medical conditions that can be dangerously affected by exposure to high levels of RF energy. People with implanted Pace-makers are the first ones that come to mind. Still 5 watts is all that I would recommend on a motorcycle. Of course the fact that most motorcycles only have a 35 or 45 Ampere alternator and by the time you run the lights, the electronic ignition, fuel pumps for the fuel injection, etc there isn't enough left to operate a 50 watt mobile rig in transmit mode for very long. The batteries just don't have that much capacity either. So there are many factors in my recommendation.

But this is the reason for some rapid deployment digi's. I am interested in the outcome of your 5 watt experiment. Let's use the MS bike ride for an example. If you could place a few of these digi's at key locations along the route to work a digis plus have an APRS station that could run 50 watts at each check-in station you might be able to give 80 - 90% coverage for the route. Then if you had a few more to install in/on some of the chase vehicles then you could watch the event progress on APRS. The down side is that you wouldn't want this in a vehicle running voice traffic on the repeater. The 2 radio's would desense each other with every transmission and you could possibly blow the front-ends with the overload.

Of course now we could discuss using the MIC-E unit's and pulling APRS data off at the repeaters input and porting it over to the APRS frequency. The MIC-E was a unit that sat between the Mic and radio with a GPS attached to it. When the PTT was released the MIC-E would inject it's APRS location and ID into a very compressed format to the tail end of the transmission. With this method you can run voice and APRS at the same time on the same radio. We thought about doing this on the 146.85 repeater but decided that against it due to lack of interest in APRS back then.

Kevin there's nothing wrong with the thoughts your having, but you might be surprised with the coverage a 5 watt ht can give you on the correct repeaters. I would add digi's but KJH-7's receiver isn't quite up to the task right now.

Kevin,

Yes in theory the distance is correct. I remember when RF exposure became an interest of the FCC. I remember when they issued a request for any information from any one in the RF industry (DELETED TO SAVE SPACE).

Well John, I got supprised allready with 5 watts out. I hit W4LAW-5 Direct, then was "wide" by KF4CFO-7.

Question I have now, mabey you or William can answer. Is there a web page on these "Digi in a Box" type systems. I have looked, but keeping getting distracted by other intersting topics.

I had actually thought about doing this. I have some of those commercial plastic tracker boxes that Terion uses for tracking vehicles with, like 18 wheelers etc. I still want to do this. I been reading some of the discussion about using more then 5 watts for these portable ideas. I have only one comment to say about this, and that is, "I believe every APRS station should never run more than 5 watts of power for any purpose." Especially any mobile station. Use the network for what it was designed for.

No, I don't think there is a web site. Something like this is what ham radio is really all about. We dream it up and then build it. This is where a ham working in communications for a public safety agency has an advantage when things get rough. Most of us will think outside the box when we have to solve a problem. If what we need doesn't exist in a ready to use form we will build something to get the job done. The US Forest service and some other agencies do something very similar to a digi in a box for a small portable (sometimes disposable) voice repeater for remote field operations. These are places where they just need to talk across a couple of ridge lines with field personnel using HT's. Find a tall tree on top of ridge in a protected place, chain the box to the tree, throw a line over a branch, pull a small antenna up, turn the radio on and the repeater is operational. In the morning come back and the change the dead battery with a freshly charged one. The repeater won't take a lot of constant use, but command and control transmissions normal only take a few seconds.

Glad to hear that you tried the 5 watt test, I spent years running only a 5 watt HT for a mobile back in the 80's so I cheated a little bit. I already knew what 5 watts could do.

866. 5 Watts on APRS

Yahoo group: EastTNAPRS
Date: 2005-11-02 16:33:34 UTC
From: Kevin R. Colvin
Topic: 866 Message: 866

As some of you have read, I beleive 5 watts is almost useless on APRS, and others think 5 watts is all that should be used on APRS. I know we all have our own thoughts about this and we all are wrong, and yet we are right.
5 watts will work. I was suprised to see just how far I got. I hit a relay digi direct in Dalton, GA. (63.2 Miles away) which in turn got me WIDE'd back to KF4CFO-7 in Athens, TN. (which is 8.9 mile away from me.) But Dalton, GA is not where I want to be heard. I do not know for sure I wasn't heard by WA4KJH-7(54.0 miles away), but by my history log, it dose not reflect it. (Doup turned off on log).
In checking the log, I see I did not hit one repeater on a regular basis. Being I really don't want to be digi'd by LAW-5, or WA4YYM, I decided to change my beacon paths. I set one beacon to APRS only. For the Locals to see, and so that others can see just how far my signal was traveling with out a digi. The other beacon was set to APRS,KF4CFO-7,WA4KJH-7. This was to try to probagate my signal only thru KF4CFO-7, (my local relay digi). And to stop unwanted QRM I was making in other areas, ie GA.
11 beacons (CFO-7,KJH-7) were sent out from midnight to 9:30 this morning, Two beacons were shown to be digi'd. and only one of the two showed to have made it to WA4KJH-7.
Some might say I need to move my antenna highter, lower, to the left,to the right, turn it to find the lobe. amoug other Ideas. I have tried them. I have tried differant antenna's. a mobile antenna. a beam, a 1/4 wave ground plain. And useing 5 watts with these antennas I still had un-reliable results.
The best antenna I have used is a J-pole. And only with about 20 watts do I have desirable results.
So Yes 5 watts will work. But for me to get desirable results from my area. 5 watts is not a choice I feel is reliable.
Conditions have a lot to do with signals probagation. Although I have had some say FM in not adversley affected by conditions, I beleive differant. This morning I showed 120 stations in my list. That puts me way over the limit on usefullyness. But if condition do not have a part. why do some days I only have 32 stations. Now with saying that, My resent testing is of no real value, being is was just done overnight. So adding in the testing I have done in the past. I still end up with the same overall results of 5 Watts not getting me into the local areas. But again that leaves open a question of what is a local area. Everyone has their own thoughts on this too. Some may say it is the area their local digi covers, where other believe it is their digi and the digi's one hop out from them. Being I am located between Knoxville and Chattanooga, I have two digi's to choose from. Wrong, I have one of those little hills between me and Chattanooga. So Now I have to try to to keep from creating useless QRM on W4LAW-3, by setting my path so I don't relay / wide into it. Too many watts out from my station will certainly create exesive QRM. So. 5 watts using relay and wide dose get me to a digi, One 63.2 miles away, but the wrong one. 20 watts gets to to where I want to get, WA4KJH-7.
If I use a path of CFO-7, KJH-7, I limit the unwanted hops, but CFO-7 dosen't have a solid path into KJH-7. That would mean I need to use Wide,WA4KJH-7 to asure I get into KJH-7. Either direct or via CFO-7.
So Yes, by me using more than 5 watts dose create some unwanted QRM. but so dose 5 watts.But thats a fact of life with radios.

The best thing I know to do, is test and to see what you need to do to acomplish what you want to acheive. And by all means, don't take just one persons views on the subject matter. We all have knowledege. The young, the old, the new, and the seasoned. Never be afraid to try something new or different. And never get offended at anothers views. For I have learned a lot from those who have have differant than my views, and I hope they continue on educating me.

PS. I have had experance with Military, Law enforcement and Fire Service radios long before I started Hamin' it. (HF, VHF, and UHF bands) I understand the comments about other types of systems. (I have seen them do some really stupid things too.)

"Two wrongs don't make a right... but three lefts do"

867. Re: [EastTNAPRS] 5 Watts on APRS

Yahoo group: EastTNAPRS
Date: 2005-11-02 18:10:29 UTC
From: John Moyers
Topic: 866 Message: 867

Kevin last time I checked atmospheric conditions had a great effect on 2m, especially in the Fall and Spring before the sun has time to heat everything up for the afternoon.

The fact that KJH-7 doesn't hear you directly doesn't surprise me either. As for KF4CFO-7 not hearing you, well I think we have looked at that horse before. But your experiment might suggest that CFO-7 is not a WIDE, but instead a local coverage digi. This gets into the definition of a WIDE. To be honest KJH-7 is almost to high to be a really good digi, but considering the distance to it's closest neighboring WIDE it has to be there. KJH-7's biggest problem is that it hears to much and it's preselector on the receiver can't be tuned low enough for optimum performance. Some where over the last 10 years I had hoped several other good WIDE's would have been installed. Say one on Starr MTN would be nice, or one over around Dayton or Nopone Mtn. Low level WIDEs, like CFO-7, are great provided the hams in that area put up enough digi's to cover the area. This is the Cellular principle for coverage. But if you can't put up a digi on every ridge top then you have to look at the mountain tops and be very selective where you put them.

Something else that comes into play is the deviation of the signal. A packet stations deviation should only be about 3 KHz for optimum use. By setting the deviation at this level the High tone will stay below 5 KHz. With a packet station's deviation set to 5 KHz you will be surprised how my packets will simply be rejected because a High Tone bit was dropped and the Checksum turned up bad. If you check KJH-7 and QEA-7 (back when it was on the air) you would find that they are set to 3 KHz. At one time I could tell which station was on the network was transmitting at any given moment by simply listening to the audio on the frequency. This shows how much variation there is in the signals. The softer levels had fewer retries and fewer dropped packets. It also helps to have the audio input set to the tnc at the correct level. As for what the problem is with CFO-7 I don't have a clue since I have never seen it and have not spent most of a day setting all the levels up, and the problem may just be that it is in a bad location for you to be able to work it.

If that is the case and you can work LAW-5 better, then why aren't you using LAW-5 instead of QRMing the Fq by transmitting the same packet over and over until it finally gets passed through a digi than can barely hear you? When the APRS station was first put into the municipal building I could have sworn that the Fire Chief at the time told me that were going to primarily use it for the EOC. If this is where CFO-7 is located then it's not a WIDE at all.

As for PWR levels. 5 watts is great if it works, if it takes 50 watts instead (guys this only a 10db increase in pwr) and that is the minimum amount of pwr needed then use it. Although at that point I might suggest using a beam for directivity. This topic started out about what to use on a motorcycle for a tracker. I still think 5 watts is the best choice when all things are considered. If you want to be heard everywhere you go then drive the car with the 45 Watt mobile in it. This is akin to complaining about being cold when riding in 40 or 30 degree weather, if you wanted to be warm you would have taken the car.....

870. Re: Setup on Motorcycle

Yahoo group: EastTNAPRS
Date: 2005-11-05 16:36:23 UTC
From: William McKeehan
Topic: 809 Message: 870

Well...

I merged two ideas into one.

The Setup on the Motorcycle and the Digi in a box.

I picked up a Brinks Home Security box at WalMart (like a cash box); it's has double steel walls. I drilled two holes in the brinks box; one on the lid for the antenna and one on the side for the GPS antenna (I have a Garmin GPS II+). Then I got two BNC Bulkhead connectors from Shields Electronics. I took my existing setup and put it in the box; strapped the box to the luggage rack on the trunk of the motorcycle and took a short ride.

In a short test this morning, I'm seeing a dramatic improvement in tracking.

Check your logs for KI4HDU-9 starting around 10:45 this morning.

871. APRS SSID GUIDE

Yahoo group: EastTNAPRS
Date: 2005-11-07 22:29:02 UTC
From: Kevin R. Colvin
Topic: 871 Message: 871

If anyone is interested, here is a repost from WB4APR, Bob

APRS SSID Guide

Since there are 20,000 APRS users on the air, the APRS maps and data can get very cluttered. Also, most operators have multiple stations on the air, such as their HOME, CAR, BOAT, and HT. It is very convenient to be able to recognize these typical applications at a glance.

Here are those common defaults:

-0 Home Station, Home Station running IGate.
-1 Digipeater, Home Station running a Relay Digi, Wx Digipeater
-2 Digipeater [#2 or] on 70CM
-3 Digipeater [#3]
-4 HF to VHF Gateway
-5 IGate (Not home station) -6 is for Operations via Satellite
-7 Kenwood D7 HH
-8 is for boats, sailboats and ships (maybe 802.11 in the future)
-9 is for Mobiles
-10 is for operation via The internet only
-11 is for APRStouch-tone users (and the occasional Balloons)
-12 Portable Units such as Laptops, Camp Sites etc.
-14 is for Truckers
-15 is for HF

Originally, in 1992, the first APRS GPS mobiles just transmitted raw NMEA-0183 GPS stings and so there was no way to insert a SYMBOL byte in the pre-formatted NMEA 183 packet. Hence we defined 14 common SYMBOLs as defaults to the 14 available SSID's that a mobile could use. These included BIKES, HELICOPTERS, AIRCRAFT, VANS and many others in addition to the ones above. This is now OBSOLETE.

In the late 1990's we came up with a better solution and defined the AX.25 TOCALL of GPSxyz for such use. In this case, the "xyz" characters can be used to define any of the hundreds of APRS symbols including Overlays. Just look up the xyz in the SYMBOLS.TXT file included in all copies of APRSdos (or these days, on the WEB).

Since this GPSxyz concept was so powerful, it completely replaced the original SSID assignments and so those original NMEA defaults have been removed from the Documentation.

However the convention for the 6 most useful ones remains and should be used in the absesnce of any other overriding conditions. Except for the TH-D7 and Truckers, the other SSID conventions mark APRS "TYPES" of users that are independent of the many SYMBOLS they can use. Thus it is nice

to know HOW someone is getting into the system, whether via satellite, HF, the internet, or touchtone. For example, using the -6 only for Space applications is so that the global APRS WEB data bases will keep statistics and data for when you are operating through the satellites separate from when you are working normally.

So stick to the standards above for the obvious applications... Of course these are not rigid. If you have more than 4 digipeaters, use any SSID you want.
These are only guidelines...

de WB4APR, Bob

872. MRX_OUTLK

From: William McKeehan
Topic: 872 Message: 872

Many of you have probably seen the MRX_OUTLK object over near the Jefferson/Sevier county line.

If you look at the status text on that object, you will see one of two things:
Activation NotExpected
Check For Activation
Also, the icon will change depending on the status; it will be the skywarn symbol when the status is "Check For Activation".

When this object has Check For Activation, you can get more details by using the "finger" command from a dos prompt:
finger MRXSWO@...

I think finger is a standard windows command, so give it a try. You should see something like this:

[wxsvr.net]

Hazardous Weather For the MRX County Warning Area from NWS Office in MORRISTOWN TN
HAZARDOUS WEATHER OUTLOOK
MRX Check For Activation

From: John Moyers
Topic: 872 Message: 873

William,

While in a meeting today I had a chance to sit down and chat with Howard Waldron with NWS for awhile. We were discussing EMWIN and the new VTEC products that the NWS is using. Between your comments and seeing Howard today has me thinking about something I was thinking about years ago.

In Florida, there are a few stations that use an EMWIN program to pull warnings and watches for their surrounding counties and then uplink those to the local APRS network. I don't remember what software they were using for the APRS side on this link, but it would parse the NWS bulletin and encode it so that it would shade the affected county until the bulletin expired.

We do something similar using WX Message for Emwin, except we don't uplink the map data but we do get a colored county on a map which we can then click and read the bulletin. I'm wondering if someone might be interested in finding out how the stations in Florida did the APRS uplinking. This would be great with our local APRS Skywarn.....

Many of you have probably seen the MRX_OUTLK object over near the Jefferson/Sevier county line.

If you look at the status text on that object, you will see one of two things:
Activation NotExpected
Check For Activation
Also, the icon will change depending on the status; it will be the skywarn symbol when the status is "Check For Activation".

When this object has Check For Activation, you can get more details by using the "finger" command from a dos prompt:
finger MRXSWO@...

I think finger is a standard windows command, so give it a try. You should see something like this:

[wxsvr.net]

I think the thing that you are talking about is already happening. I'm not sure of the source of the data, but when sevier weather comes along, I see my counties get colored based on weather warnings/watches that are active and I see boxes drawn for areas to watch; I'm pretty sure that UI-View also supports this and I think that WinAPRS is the one that started it.

I have my IGate configured to gate these warnings/watches from the Internet to RF for anything from MRX.

With UI-VIEW32, using UI-NWS and UI-Radar, we get all the things you have mentioned. Those do require an internet connection. I am glad to see William "rebroadcasting" the NWS objects. It is a BIG help to Skywarn.

876. Pros and Cons of APRS Software

Yahoo group: EastTNAPRS
Date: 2005-11-10 14:06:22 UTC
From: William McKeehan
Topic: 876 Message: 876

I know that each of us has our own favorite software program for APRS. I would like to start a discussion about why a particular program is your favorite. I'll be happy to start with my favorite program; Xastir.

Pros:
1. Xastir is an OpenSoftware solution. This means not only is the program free, but you get the source code with it to change as you see fit. It also means that there is a community of developers working on it, not just one individual.

2. Map format support. Xastir supports a variety of map formats including: DosAPRS, WinAPRS, X-APRS, MacAPRS, PocketAPRS, USGS GNIS, Weather Alerts, Tigermaps, ESRI Shapefiles, Image Maps, Internet Maps (including radar images), UI-View Maps, OziExplorer Maps, USGS DRG Topo, USGS SDTS, and MapInfo.

3. Ability to layer maps on top of each other. For example, I can have a satellite image overlaid with shapefile street-level maps, then I can overlay a course map on top of that. The number of levels are virtually infinite.

4. Multiple-window messaging. Each "chat" session is opened in a separate window. This lets me easily have multiple chats going on at the same time and help to keep them separate.

5. Ability to customize display. I can display any combination of the following on my display: callsign, symbol, course, speed, altitude, weather information (weather text, temp only, wind barb), power/gain circle, distance/bearing and last report age. This information is presented around the icon, so I can see all of it without moving the mouse or opening any other window.

6. Maps automatically picked based on location and zoom level. I have my station configured so that at a zoom level where I see the entire us, I see State outlines and Interstates. As I zoom in, more details appears until I get to a pretty low zoom level where I show satellite images overlayed with street level maps.

7. Station Trail display. If I look at my display I can tell where mobile stations have been recently (user configurable amount of time). So I don't have to watch the display to have an idea of what's happening. For example, if I look at my display now and see KE4FGW-9 sitting stationary, then I look an hour later and see KE4FGW-9 sitting in Gatlinburg, I will see a trail showing me the path that he took to get from one place to the other.

This is by far not all of the features of Xastir, but some of the tops in my book!

BUT, Xastir is not perfect...

Cons:
1. Xastir is difficult to install. It is primarily a Linux based program. To run it under Windows you must first install Cygwin - a unix type environment that runs on Windows.

2. Map flexibility = difficulty. Supporting a number of map file formats leads to no single solution. Each user has his/her own set of maps for Xastir. The configuration options (what zoom level the maps appear at, what order they are layered, etc) take some time to understand and get configured to your personal preference. Also, some care has to be made to make the maps perform well.

3. Xastir can be compiled with different options, so what works for me in my build of Xastir may not work for you with your build.

4. Station lists are not sortable.

I'm sure there are more negative things about Xastir as well, but these are the things that I see as big issues.

So tell me...what's your favorite program and what are it's pros and cons?

878. [Fwd: [APRS] ANSR-27 Flight Announcement]

Yahoo group: EastTNAPRS
Date: 2005-11-10 16:59:00 UTC
From: William McKeehan
Topic: 878 Message: 878

If anyone is interested in trying some UHF Telemetry DX with APRS...

---------- Original Message ----------
Subject: [APRS] ANSR-27 Flight Announcement
From: "kd7lmo" <mgray@...>
Date: Thu, November 10, 2005 10:54 am
To: APRS@yahoogroups.com

Arizona Near Space Research (ANSR) is pleased to announce the flight of ANSR-27. This high altitude balloon flight will take place on Saturday, November 19th at 9:00 AM MST (1600 UTC). The launch site will be announced closer to the flight date and will be based on winds aloft.

The balloon will be a 3000-gram weather balloon, filled with helium. The expected burst altitude will be 90,000 feet or more. The flight is anticipated to last about 2.5 hours from launch to touchdown.

The flight will feature payloads designed and built by university students through out Arizona.

The flight will also attempt to set two records as part of the 2005 Onset ARHAB (Amateur Radio High Altitude Ballooning Record) competition. The portion we are attempting on this flight includes:

1. VHF/UHF Greatest Telemetry Distance (APRS on 445.950 MHz)
2. Greatest 2-way QSO (Cross Band Voice Repeater)

We need your assistance (especially distance stations) in an attempt to set these records. VHF/UHF stations in Southern California, New Mexico, and Colorado Mountain Tops would work best for the 2-way QSO and telemetry attempts. The following is an approximate coverage map:

http://www.kd7lmo.net/ansr_repeater.html

The following is the payload frequency plan:

Cross Band NB-FM Voice Repeater
Input: 145.560 MHz/162.2 Hz PL tone
Output: 445.525 MHz

APRS when repeater not in use on 445.950 MHz at 10, 20, 40, and 50 seconds UTC time via KD7LMO-11

Landing prediction after burst at 15 and 45 seconds UTC time via KD7LMO-0

Pico Beacon APRS
445.950 MHz packet at 0, 5, 20, 25, 30, 55 seconds UTC time via KD7LMO-11

Our mobile cross band Digipeater will repeat the APRS data to the
144.390 MHz standard APRS frequency and thus will be I-GATED to the Internet
for out of area trackers. You track the flight using either of the following
links:

http://www.findu.com/cgi-bin/find.cgi?kd7lmo-11
http://map.aprsworld.net/kd7lmo-11

Please pass this message along to other interested parties, espeically those
stations that are 300 - 500 miles from Phoenix, Arizona. If you are busy on
Flight Saturday, but have a UHF beam and APRS station, consider setting your
station up in monitor mode. Point your beam 5 - 10 degrees off the horizon
toward Arizona. When you check your APRS log later in the day, hopefully you
will have some position reports.

73s de KD7LMO

880. 1500 M Wire harness

Yahoo group: EastTNAPRS
Date: 2005-11-11 22:23:19 UTC
From: ke4cqw
Topic: 880 Message: 880

Hi all,

Well I am not sure whats up with my other radio (a old Yeasu FT-2200) It works fine in the house but put it in the car and the TNC-X system it works fine for a while then goes ape...Works like a champ with the AEA PK-96... been going for days...

So I am wanting to wire the Yeasu 1500M up but I am really not sure what the heck I am doing... imagine that! :)

Here are my questions - This is all going into a single mini din plug on the 1500 M.

Pin 1 Data in - that is the speaker input from the radio to the TNC.

Pin 2 GND - I am guessing that is speaker GND or that all the grounds? (see below)

Pin 3 PKT PTT - In the manual it says "GND = TX and Open = RX" I am guessing this is the "2nd" ground for the keying circuit?

Pin 4 is not used in this application it is the 9600 baud Packet Data
Pin 5 1200 Baud Packet Data Out - Data from the TNC to be TX'ed out.

Pin 6 SQL - I am not sure what this is for? Does the TNC listen to 2 seperate sql circuits? I was thinking the data in on pin 1 would tell the TNC if a signal was present? I am not really sure what this does...

Now this is the information I have on the TNC-X - 2 plugs only a mono plug and a stereo plug.

The RX audio is on a mono plug with the following pin information - Pin tip is RX in and Ring is GND

The other plug is a stereo plug with the following information - Pin tip is mic (TX) audio, the ring is is the PTT and shield is GND. I am not sure what the lay out of this plug is I know what the tip is but which is the ring and which is the shield? I am guessing the ring is the "middle" and the shield is the furthest from the tip?

Thanks for the help... I build 100K robots for a living but seem to have all kinds of trouble fixing a TNC up... dugh! :)

73, Moe N4CQW

Moe, you are getting there.? Sounds like you will have it running pretty soon.? I wanted to offer what little I know on what you wrote.? First of all, the tip is the end furtherest from the shield.? The shield is the ground, the largest round piece of that plug.? And you are right, the ring is the middle conductor.? Now on the mini DIN,?I don't have the diagram in front of me, but it sounds just like all the other mini DIN connectors out there.? Pin 2 is the ground.? The ground for the entire circuit, wheather it's for the radio, PTT or the speaker is this ground connector.? Pin 3 is for the PTT circuit.? Do not ground this connector except when you want to transmit.? There needs to be a PTT line coming from the TNC, this line will go to pin 3 of the radio.? The fact that a ground condition here means that the PTT is active low.? So hopefully that TNC will be an active low to transmit.? Most likely it will be.? Pin 5 is the 1200 Baud packet data from the radio.? This will go to the data in on the TNC.? Data out from the TNC will go to pin 1 which is the data in line.? Do not connect this to any speaker.? Pin 6 can be used to let the TNC know when the frequency is busy.? If the TNC supports this line, then you can use it.? Otherwise, like most TNCs, the TNC will detect wheather or not the frequency is busy by listening to the 1200 baud line in connector.? This is call software squelch.? The TNC uses the CD command to tell it which way to go on this.? If the TNC has a data or busy light on it, then you can use this to determine wheather or not the TNC is set up correctly.? It will show you if it hears data on the data in line.? Since you are using a mobile radio, you will not need the 2.2K resistor in line with the mic audio on the radio.? Hope this helps some.

From: Scott
Topic: 883 Message: 883

Hey folks,

In the files section, I added a scan out of the Yaesu manual showing the hookup diagram for the new "mini din" packet jacks. These jacks are on most of the newer rigs today.

Hi all,

I am not sure who was asking a few days ago about images and weather information that you can get out of UI-View32. I uploaded a screen shot from a couple of months ago of the tornado out break in Alabama from one of the hurricaines. I am also trying to upload another screen shot that is different one but a bit of a "zoom in".

From: "Scott" <na4it@...>
Subject: Palm Pilot w/ GPS to TMD700A

Guys, I am seeking input here.

The TMD700A setup I am working on, the guy who owns it has a Palm w/ built in GPS and maps.

Anyone know if it could be interfaced to the TMD700A, not as a "controller" but as a GPS that would show stations on it's maps?

Sure would be a neat deal if it did...

The output of the GPS (NMEA) could be input to the D-700 in "APRS" mode and if the setting in the D-700 is set to "Waypoints-ON" then the Palm should see the stations as the D-700 hears them and sends them back to the GPS, although I don't think the regular icons will be seen...only the station names. There is another setting which will allow several digits more to be added so the entire SSID (eg. WA4YYM-11 rather than just WA4YYM). Only with an APRS program (such as UIView) can the icon and additional information such as status comments be seen. There used to be a program called Pocket APRS which I used for awhile which had full APRS capability with a GPS input, but this program is no longer available or supported by its author, Mike Musick. I think there is an APRS program available for the pocket PC, but I have no knowledge about it.

That's good info Don. I need to tell Wade to turn that on anyway for his current GPS.

The 700 is one slick little radio. We set his up with the PM memories like this:

PM1 = normal operation both sides (voice)
PM2 = APRS left, voice right (TNC comes on automajicly)
PM3 = Packet left, voice right (GPS still plugged in, laptop w/ UI-VIEW added.
PM4 = Still waiting for a function
PM5 = Cross band repeater freqs

I would have to agree about the D700; I have mine setup similar

PM1 = normal operation both sides (voice)
PM2 = Still waiting for a function
PM3 = APRS left, voice right (TNC comes on automajicly)
PM4 = Packet left, voice right (GPS plugged in, laptop w/Xastir)
PM5 = Cross band repeater freqs and setup

Having these setups stored makes switching between them very easy. It has to be one of my favorite features of the D700.

From: William McKeehan
Topic: 888 Message: 888

I added an Xastir screenshot to show what Xastir's mapping and station trail look like. This is from a trip that I took this evening to Dandridge and back; the yellow line shows my trail or the path that I took.

Have a look to see what I see...

One other comment on the PM functions in the D700, there is a setting in the menu (and I don't have a manual here) that is actually defaulted the wrong way. It lets the PM memories get wiped out when you turn the rig off. Bad idea. Make sure you change that setting.

(William, you might look that up and give the menu number and more info on it.)

Awsome! I assume this track was done from the laptop in the car tracking you, am I correct?

My track was done from my home machine using the data captured via RF.

Does APRS+SA provide this type of trail for all mobile stations or just your station?

Anyone else got any screen shots of different programs so we can all get an idea of what the differences in appearance may be?

From: William McKeehan
Topic: 885 Message: 892

Hmmm....the only setting that I can think of that may be what you are talking about is the 1-4-1 (Radio-Memory-Auto PM Channel Store) setting. My D700 came with this in the default of ON.

What this will do is if, for example, you are in PM 1 and you make a change (change frequency, TNC mode, anything), then power down or switch to another PM, then the change will be automatically stored in PM 1, so the next time you switch to PM 1, you will get the new configuration.

Is this what you are talking about Scott?

I have mine set to ON, so when I make a change it sticks; I can see wanting to set up the PM's, then turning this off so any changes you make will not alter what you had saved.

BTW, in addition to PM 1-5, there is also the PM OFF setting. The settings for PM OFF are not stored like the PM1-5 settings, but if you want to try something without messing with a PM setup, going to PM OFF gives you basically a 6th setting to play with.

That was from the laptop in my car, but could have been from a home station or anyone's station running APRS+SA.? You can do that for any station that hear or have in the received list, RF or the internet.? This is what I use while tracking a balloon.? I can see the track lines of where it's been and see what course it's heading towards.? You can actually do this for any number of stations at one time.? You can do it for stations within a recent range from any other given station also.

One last question...

Is the trail just done on the stations that you are tracking? or on all mobile stations?

Xastir does all mobile stations - I can see advantages to both ways.

Well I'm not sure what you mean, but you can do this to any station even if you are not racking it.? For instance, I still have all the data?in the latop from yesterday's ride, so I double clicked certain stations and could see their tracks.? I can click on the?"Map Moving List" or the "Map Fixed List" buttons to see everyone in that list on a map.? So I could do all mobile stations or all fixed stations or a combination of any.

That's it William. For some reason, Wade's was OFF.

898. TNC Setting

Yahoo group: EastTNAPRS
Date: 2005-11-15 02:05:33 UTC
From: ka4tar@charter.net
Topic: 898 Message: 898

Could someone give me the setting for my tnc? I want my radio and tnc to work when i turn off my computer.
TNC is kpc-3.
Thanks, Darrell

Darrell, let me see if I can get a little more information from you.? What is it that you want the TNC & radio to do after you turn off the computer?? Do you want it to be able to continue sending position reports or act as a digi?? What is it not doing for you??

David, I need it to continue sending position reports after I shut down the computer.
Its been so long since I ve use the pk3 I forgot how to set it up for that.
Im running street atlas 6.0 with aprs+sa.

From: David Hoffman
Topic: 898 Message: 901

Darrell, I'm assuming that this station will be stationary as in your home station.? If so, you can do this by giving the TNC your coordinates that you want beaconed every so often.? If this station is mobile, you?ll need a GPS and a KPC3+ with at least version 8.2 firmware.? If this station is indeed stationary, then any version of KPC3 firmware will work.? In fact, I?m assuming you have a firmware version of an older TNC like version 5.1.? If you have one of the newer firmware versions, then you can utilize the newer GPS commands available for this.? You will need to do the following commands from a Hyper Terminal session.? Establish a connection to your TNC via Hyper Terminal.? You can stick the same string that APRS+SA is sending out in your BTEXT field.? Then change your beacon rate using the BEACON command.? I?ll provide the commands below. ?Another thing is I noticed that your station is sending out a periodic ID string such as
KA4TAR>ID,WA4KJH-7*,WIDE,WIDE,qAR,KI4HDU-2:KA4TAR/R RELAY/D KA4TAR-1/B.? This is not recommended on the APRS frequency as it causes more traffic.? This can be turned off by using the HID OFF command.? It looks like your using RELAY,WIDE,WIDE for your path.? So make sure that this path is in your UNPROTO field.? You can adjust your beacon rate to what ever, I just showed once every 60 minutes below, 60 minutes because you are stationary station.? You can use what ever value you feel works for you here.
ECHO ON
AUTOLF ON
INT TERMINAL
BT =3545.37N/08328.53W-PHG5848 KA4TAR Near Pigeon Forge and Gatlinburg, TN
B EVERY 60
HID OFF
U APS227 VIA RELAY,WIDE,WIDE
Now each time you run APRS+SA, it executes certain commands as part of it?s initialization, to change some of the TNC fields.? You can see what commands get executed by looking at the initkpc3.tnc file in the C:\Program Files\APRS+SA folder.? So every time I want to leave APRS+SA and run HyperTerminal, I have to run the ECHO and AUTOLF commands at a minimum to see what my terminal program is doing.? APRS+SA also turns the digi on.? You could leave this on if you are running this station off of a power supply.? It helps RELAY stations get relayed, but this is of the old APRS theory.? And that?s a whole nother topic. ?If on batteries, and the digi command is set to on, you could drain your batteries pretty fast.? If you have a newer version, then I?ll give you the commands for those newer GPS commands to do the same thing.

Moe and the group,

I have used the Storm Predator software for several
years and it really works well. It does loops, tracks,
paths, etc.. It is not freeware though. The link is:

http://www.stormpredator.com/details.htm

I had mine on the Nashville NWS most of yesterday and
found it very useful with tracking the storms..
Basically, it can connect to any NWSO that has radar.
It can do short or long range displays and updates
automatically every 5 minutes.

905. 2005 SKYWARN Recognition Day

Yahoo group: EastTNAPRS
Date: 2005-11-17 19:16:18 UTC
From: William McKeehan
Topic: 905 Message: 905

I just added an event to the calendar of this group.

The event is the 2005 SKYWARN Recognition Day. 2005 SKYWARN Recognition Day will be December 3, 2005 (0000 - 2400 UTC).

The objective for this event is for all amateur stations to exchange QSO information with as many National Weather Service Stations as possible on 80, 40, 20, 15, 10, 6, and 2 meter bands plus the 70 centimeter band. Contacts via repeaters are permitted. SKYWARN Recognition Day serves to celebrate the contributions to public safety made by amateur radio operators during threatening weather.

APRS is one mode that some of the NWS stations will be operating on.

See: http://www.crh.noaa.gov/hamradio/index.php for complete details.

Seems to me like a great way to show how APRS can be used to get messages to/from NWS stations.

> Greetings Everyone,
>
> This is to remind you that EmComm testing will take place this Saturday, November 19, 2005, at 10:00 am at Grace Lutheran Church, 9076 Middlebrook Pike, Knoxville, TN. Grace Lutheran Church is a gray colored building on the south side of Middlebrook between Cedar Bluff and Chert Pit Roads. Here is a link to a Google map of the area: http://tinyurl.com/alfcv. Talk in repeater is 146.625 (+ offset). There will be other activities going on in the front part of the facility so participants should park beyond the Office entry door, leaving the north side of the lot (toward Middlebrook) open for church activities. We should use the Office door and proceed to the right as we go up the hallway. A sign board will identify the room.

908. WIDEn-N in our area ?

Yahoo group: EastTNAPRS
Date: 2005-11-22 16:47:41 UTC
From: William McKeehan
Topic: 908 Message: 908

KA4TAR has enabled a digi at his location. He appears to have it configured as a WIDEn-N digi. This digi has a high antenna and nearly as large of a coverage area as WA4KJH-7.

If you can be heard by KA4TAR, I encourage you to play with WIDEn-N paths such as:

WIDE2-2 or WIDE1-1,WIDE2-1 or WIDE3-3 or WIDE1-1,WIDE2-2

to do some messaging to learn more about how WIDEn-N works.

Let me know what you discover...

909. Problem with PK-232MBX

Yahoo group: EastTNAPRS
Date: 2005-11-24 04:59:50 UTC
From: Greg Williams
Topic: 909 Message: 909

Hello to the group:

Over the last 3 days, my TNC has become "stuck" twice. The first time it happened, it was hearing, but not transmitting. I got lucky and was able to get it back to working, but now it's both deaf and mute and my tricks to wake it up have failed.

I've power cycled PC, TNC, and radio. Unplugged TNC and waited 3 minutes. I shut down PC, TNC, and Radio, then powered on PC, fired up TNC, fired up radio, and then started UI View.

http://www.packetgnomes.org/~chris/kd7dvd/equipment/pk-232/ - image of TNC.

The four LEDs on the far left light up. They are labeled MULT, SEND, STA, and CON. They are in the STATUS area. The radio does not transmit.

I opened it up and did a hard reset by removing JP1, then I restarted everything. UI-VIEW can get something out of it, but now I get the following:

```
*** COMMS ERROR - Break Received
*** COMMS ERROR - Break Received
*** COMMS ERROR - Break Received
*** COMMS ERROR - Framing Error
*** COMMS ERROR - Break Received
*** COMMS ERROR - Framing Error
*** COMMS ERROR - Break Received
*** COMMS ERROR - Framing Error
*** COMMS ERROR - Break Received
*** COMMS ERROR - Framing Error
*** COMMS ERROR - Break Received
*** COMMS ERROR - Framing Error
*** COMMS ERROR - Break Received
*** COMMS ERROR - Break Received
*** COMMS ERROR - Framing Error
21:34:41T K4HSM>WA4KJH-7,WIDE,WIDE <UI C Len=49>:
=3558.05N/08401.50Wrk4hsm@... {UIV32N}
```

When I try to go to Hyperterminal and go through COM1, it hangs. No response from the TNC. Now, the PKT and RQ/CMD LEDs illuminate (after I started UI View) as if it's ready (the other LEDs are off), but I think my jumper reset has now screwed that up with the above errors, and it does not transmit.

The internal battery looks hardwired in, so I dont know if thats an issue or not.

Any help is appreciated as I wrestle with this Turkey on Thanksgiving.

Other specs:
AEA PAKRATT 232 Model PK-232MBX
Yaesu 2200 2m FM mobile
Homebrew PC with WinXP
UIView32 for APRS program.

Greg Williams, K4HSM.

From: Scott
Topic: 909 Message: 911

Hi Greg,

(1) Are the 4 lights on the left still stuck on? If so, check the following.
(a) Make sure you have good power feeding it. It needs 12-13.6V with at least 1 amp solid.
(b) If (a) is OK, check the 5V regulator for 5V output (it's the one with the diamond shaped heatsink. If it is bad, Radio Shaft has them for $2.50.
(c) If (a) & (b) are OK, go to step (2).

(2) Either do one or the other, remove the reset jumper 9turn it around and put it on ine pin only) or remove the battery. With software control, you don't want the TNC to remember anything.

(3) In the files section of this group, I will put a command file for the PK232MBX for UI-VIEW. It is labeled "PK-AUTOB.CMD". It will force the TNC to reset and load all the correct parameters for UI-VIEW. Select it with "Handshaking" NONE and "Host Mode" NONE. After it initializes, you can go in and change it to "Host Mode" KISS and undet the "SETUP" box, click "PK" the "OK". (It will work fine not in KISS mode. KISS mode is only needed if you are going to digipeat.)

912. Power Supply request

Yahoo group: EastTNAPRS
Date: 2005-11-26 04:15:22 UTC
From: Greg Williams
Topic: 3 Message: 912

Hello gang:

Still working on the TNC issue with my PK232. I discovered my power supply was the wrong rating. After finding and downloading the manual, I found that Im running a 500mA supply when it should be a 700mA.

If anyone has a DC adaptor rated at 12-16V, 700mA laying around, please let me know, and I'll gladly accept one. Thanks everyone.

I talked to him Moe, and the PS he had was reverse wired. I told him
he may have to replace some protection diodes also. I just run mine
off the shack supply.

As I understand it, the only official stations involved are NWS stations. If you are not one of those, then just you don't need to do anything, just start making contacts with the NWS stations.

Good luck! Let us now how many you are able to contact.

Well I have operated from WX4MRX a couple of times since they started this, and was wanting to operate WX4MRX from the NWS office. I usually ran the overnight shift.

I contacted Howard Waldron and am waiting on a reponse.

Thanks.

924. UI-VIEW SETUP FOR FILL-IN DIGI AND FULL DIGI

Yahoo group: EastTNAPRS
Date: 2005-11-28 12:49:21 UTC
From: Kevin R. Colvin
Topic: 924 Message: 924

WITH THE GROWING USE OF WIDEn-N IN THE AREA, AND UI-VIEW BEING USED BY MANY. HERE IS HOW TO SET UP UI-VIEW AS A FILL-IN OR FULL DIGI TO SUPPORT THE NEW PARADIGM. (Per Ron/AC7TK)

TO SUPPORT THE OLDER PARADIGM OF WIDE AND RELAY, ALL ONE MUST DO IS ADD RELAY AND WIDE IN THE ALIAS BOX.

PLEASE REMEMBER, TOO MANY DIGI'S CREATE DOUPS, AND/OR WILL KILL (USE UP) THE PACKET BEFORE IT GETS DIGI'd OUT VERY FAR.

THANKS. . . KEVIN / KF4YMC

UI-View32 Fill-In / WIDEn-N settingsUI-VIEW SETUP FOR FILL-IN DIGI AND FULL DIGI
Here is what is required to setup UI-View32 to run as a "New Paradigm" digi. Two configurations are presented,one for a "fill in" digi that would only respond to WIDE1-1, and one for a full WIDEn-N digi.

Setting up UI-View32 to act as a fill-in digi.
You must be running your TNC in KISS mode to enable the digipeater in UI-View32.
Go to Setup -> Digipeater Setup
Enable Digi is checked
UI Only is checked
Alias substitution is checked
WIDEn-n is not checked
TRACEn-n is not checked
Alias(es) has AC7TK,WIDE1-1 <substitute your callsign for mine>
Sub Alias has AC7TK <substitute your callsign for mine>
Dupe secs = 30
Digi routes has 1=1
Click on OK and you're done.

Setting up UI-View32 to act as a full WIDEn-N digi.
You must be running your TNC in KISS mode to enable the digipeater in UI-View32.
This involves opening up a text file, editing it and saving it. I recommend that you first save a copy of the original file so if something happens you can easily revert back.
Open the UIVIEW32.INI file (located in C:\Program Files\Peak Systems\UI-View32\) scroll down to the section named [DIGI_OPTIONS] and set it to match this:
[DIGI_OPTIONS]
DIGI_ENABLED=TRUE
UI_ONLY=TRUE
ALIAS_SUBSTITUTION=TRUE
DUPE_SUPPESS_SECONDS=30

```
ALIAS=WIDE6-6,WIDE6-5,WIDE6-4,WIDE6-3,WIDE6-2,WIDE6-1,WIDE5-5,WIDE5-4,WIDE5-
3,WIDE5-2,WIDE5-1,WIDE4-4,WIDE4-3,WIDE4-2,WIDE4-1,AC7TK <substitute your
callsign for mine here>
UIFLOOD=TN <enables TNn-N paths in Tennessee, substitute your state or
province>
UITRACE=WIDE
WIDEN-N=TRUE
TRACEN-N=TRUE
SUBST_ALIAS=AC7TK <substitute your callsign for mine here>
EXCLUDED=""
[DIGI_ROUTES]
1=1
And in the UI-View32 program:
Setup -> Station Setup: Beacon comment:PHG5110/Wn,TNn/Eugene <substitute
your actual PHG and City here>
Setup -> Station Setup: Symbol:No.Digi O'ly:S
Info provided by Ron/AC7TK in Eugene, OR
```

925. TRIMMING PATHS

Yahoo group: EastTNAPRS
Date: 2005-11-28 13:29:29 UTC
From: Kevin R. Colvin
Topic: 925 Message: 925

Since most know that I am not good at explaining things and my spelling is terriable, I am posting this comment from James / VE6SRV who has explained why we must trim digi paths.

Thanks. . . KF4YMC / KF4YMC

I have to get my two cents worth in again:
This concept is worthy of repeating ad naseum until everyone understands it completely. It is the fundamental reason why there is so much work being done to try and trim paths, and optimize settings.

A single radio frequency can only contain one signal at any given time (in the FM world of APRS). When my transmitter is keyed up, I am either sending data out for other stations to copy, or interfering with another station.

If my transmitter is on 100% of the time, I am the only user that can use the channel to send data. If I reduce my duty cycle to 50%, that channel can now be used by 2 users (at 50% duty cycle) to send their data. If a third station tries to join in on the channel using a 50% duty cycle, you are going to end up with virtually zero throughput.

While these are extreme values, the concept is valid... if there are enough stations transmitting the channel can be filled to capacity. So, at what point does the real world APRS channel get to the point that channel loading becomes a problem?

Channel loading is really a study in statistical analysis, factoring the number of users, and their transmission rates, etc. The simple answer is a rough estimate of around 60 users. Obviously 60 mobile users transmitting once every 2 minutes will load the channel much more than 60 home stations transmitting once every 10 minutes. So, some areas at times may see high utilization with 50 users, while you might be able to still fit more people on the channel in another are with 80 people in the area.

Now, the other half of the equation... what is the local "area"? Let's pretend we live way out in the boonies in Springfield, and have a single digipeater all by itself. Obviously anyone we hear on that digipeater is a "local" to the area. Any transmissions we hear on that digipeater are using up some of our local airtime, so we count that as part of the channel load. Let's also say that we get enough users that our local channel load gets up to 60%.

Down the road in Shelbyville, they too have a digipeater, and have also gotten to a channel load of 60%. All is fine and dandy, there's still lots of room for more users in each city. But, lets now add in the concept of paths. The APRS users in Springfield and Shelbyville have up until now been sending packets out with only a single hop since they were alone in the world. Now they have discovered that they can have a network, and share data between the two cities. So, everyone changes their paths to WIDE2-2, so that they can be seen in the neighboring community.

Anyone do the math yet? 60% channel load in Springfield plus the 60% channel load in Shelbyville equals 120% network channel load. So, what happens? We end up with reduced

reliability and throughput due to collisions.

Let's take this concept and add another city, say Morganville as the third vertex on a triangle, and define the APRS network such that each city's digipeater can hear the other two. Let's also reduce the channel load in each city to 40%. You can see that we still have a 20% overload on the channel.

How do we relate this to the real world? Have a listen to your local digipeater. Count the number of stations heard on that digipeater. Count all of them, not just the ones that are heard by it on the first hop. Any packet digipeated by the digipeater is a packet that is adding to the channel load. APRS stations that are 3 hops away, and are showing up on your screen with WIDE3* are still considered local users, and are adding to your local channel load.

So, if your local channel load is getting really close to 100%, or even beyond that, what can you do to help reduce the load? The easiest solution is to ask everyone to reduce their path. Stations 3 hops away now no longer load your local digipeater. The local channel load drops, and reliability increases due to fewer collisions.

There are other ways to reduce channel loading, such as relocating the digipeaters to reduce the coverage area. Just like the cellphone companies, cell size is reduced as user density increases. Those mountaintop digipeaters that can hear for hundreds of miles around can effectively pull hundreds of users into areas that are already struggling under their local user burden. Adding another local digipeater to help with the load actually adds to the problem UNLESS each digipeater has a unique footprint. Adding digipeaters to the network without reducing the footprint of existing machines can simply increase the load.

I'd like to leave you with one final concept that gets missed by most people. Let's step back to Springfield and Shelbyville once again. Both have their local digipeater, which can hear the digipeater in the other city. In an effort to reduce channel loading, they decide to reduce their paths from WIDE2-2 down to WIDE2-1. This will keep their position reports local, only being digipeated by the local machine.

If you listened to the audio of the local digipeater in Shelbyville, you would be able to hear dead air, and could easily assume that there's room for more users. However, you have to remember that the Shelbyville digipeater can hear the Springfield digipeater. During that dead air that you hear in Shelbyville, the local digipeater may very well be listening to packets such as:

```
H0MER>WIDE2*: Mmmm, Donuts!
L1SA>WIDE2*: I want a pony.
MA6GIE>WIDE2*:<SUCK><SUCK>
```

A strong local station through the magic of FM capture effect might be able to get the attention of the Shelbyville digipeater, but a user on HT might not.

So, remember, even though it sounds like the local digipeater has a bunch of dead air time, it may actually be busy receiving packets with used up paths that it simply ignores.

I'm not using UI-NWS, but I do not see any active watches or warnings for East TN.

Looking at the NWS web site, I don't see any watches or warnings either; where are you seeing them?

There is a tornado watch in Middle TN coming from OHX, which I have set to come up on screen.

The only thing I am seeing in UI-NWS is stuff from hams in AL, and I didn't think they could put data in to that. I thought only the NWS could. Weird.

From: David Hoffman
Topic: 926 Message: 934

Warning Description: High Wind Advisory
Warning Date: 10:02 am EST on November 28, 2005
Warning Summary: ...Wind Advisory In Effect Until 6 Am Est /5 Am Cst/ Tuesday...
Warning Message:
The National Weather Service in Morristown has issued a Wind
Advisory...which is in effect until 6 am EST /5 am CST/ Tuesday.
The biggest threat will be to the higher elevations of the
region...typically above 2000 feet. Some localized areas below 2000
feet could also see these strong gusty winds.
A Wind Advisory means that winds of 31 to 39 mph and/or gusts of
40 to 57 mph are expected or occurring. Winds this strong can
make driving difficult...especially for high profile vehicles...
so use caution when driving. Some shallow rooted trees could also
be blown over with winds of this strength.
Warning Description: Special Weather Statement
Warning Date: 2:40 am EST on November 28, 2005
Warning Summary: ...Slight Risk Of Severe Thunderstorms Late Today And Tonight...
Warning Message:
...Strong winds in the mountains today and tonight...
A very strong low pressure system over the Midwest United States will
track northeast today...pushing a cold front across Tennessee this
afternoon through tonight. Ahead of the front...a strong south wind
will bring warm and moist air to east Tennessee...southwest
Virginia...and southwest North Carolina. This air mass combined with
strong and turning winds above the surface will lead to a threat of
severe weather across the area. The main severe weather threat will
be damaging wind gusts. Some tornadoes will also be possible.
Locations with the greatest chance of severe weather will be in the
southern Cumberland Plateau and the southern Tennessee Valley...
including Chattanooga. The time of the greatest severe weather
threat will likely be from around sunset in the plateau counties to
around midnight in the mountains.
The strong southerly winds ahead of the low pressure system will
also result in winds in the mountains today and tonight between 15
and 25 mph...with gusts up to 40 mph. These winds could blow down
tree branches and overturn unsecured outdoor objects. Drivers of high
profile vehicles should use caution.
Law enforcement agencies...emergency management officials...storm
spotter groups...and other interested concerns should monitor this
situation and take appropriate action should severe
weather threaten your area. All residents of east Tennessee...
southwest Virginia...and extreme southwest North Carolina should
monitor the latest statements from the National Weather Service.

935. URGENT! UI-NWS Shape file have changed!

Yahoo group: EastTNAPRS
Date: 2005-11-28 19:38:18 UTC
From: Scott
Topic: 935 Message: 935

Our problem is that the County shape files changed on Nov 15th! The correct file to download are:

Zones
NWSI Libraries: Zone Forecast Areas, and then Public Forecast Zones (CONUS/OCONUS), Download Compressed shapefile.

http://www.weather.gov/geodata/catalog/wsom/data/z_14jl05.zip

Marine zones
NWSI Libraries: Coastal And Offshore Marine Zones, and then Coastal Marine Zones including the Great Lakes, Download Compressed shapefile.

http://weather.gov/geodata/catalog/wsom/data/mz12jl05.zip

and

http://weather.gov/geodata/catalog/wsom/data/oz15de04.zip

Counties
County Libraries: AWIPS Counties, and then US Counties (CONUS/OCONUS), Download Compressed shapefile.

http://www.weather.gov/geodata/catalog/wsom/data/w_28de04.zip

Most of these are huge files. 3-9 MB!

941. Re: Setup on Motorcycle

Yahoo group: EastTNAPRS
Date: 2005-11-29 15:57:11 UTC
From: William McKeehan
Topic: 809 Message: 941

For future reference...

The bungie cord solution to hold the black box on the luggage rack of the motorcycle has some limitations.

This past Saturday, I was riding down Kingston Pike with a group of about 12 bikes. I hit a large hole in the road and took a big bounce. When the motorcycle came back down, the black box was still flying in the air. It went splat on Kingston Pike. Somehow, nothing got ran over.

I turned around and was able to fetch everything from the box. The box itself took most of the damage. The lid was opened (it had a locking lid) and the contents were spilled on the road. The radio has a little road rash, but still works just fine. The GPS managed to stay in the box and came out unscratched.

So my future plans (after Christmas at the earliest, and maybe not until I get the new bike) will include something a little more substantial to tie the box to the bike.

942. [Fwd: [aprssig] AGWTracker now with dynamic mapping capability built-in]

Yahoo group: EastTNAPRS
Date: 2005-11-29 16:02:12 UTC
From: William McKeehan
Topic: 942 Message: 942

Here's a bit of an introduction to a different piece of APRS software than most of us use. It's AGWTracker.

It's super easy to setup (especially if you already have AGWPE setup), so give it a try.

---------- Original Message ----------
Subject: [aprssig] AGWTracker now with dynamic mapping capability built-in
From: "Amateur Radio WB8NUT" <duffy@...>
Date: Mon, November 28, 2005 10:35 am
To: aprssig@...

I thought a few of you might be interested in trying out AGWTracker from George, the author of AGWPE packet engine. I was interested in trying it because I was a user of UI-View and want to move away from it since the code is frozen, no further development and the source code having been destroyed after Roger?s death (such as waste). Maybe you tried AGWTracker in the past and did not like it because it did not include dynamic mapping capability.

Well all that has changed now. George has added Virtual Earth and Google mapping to the product. Now you can zoom in and out, up and down, and side to side. And it even uses your old UI-View maps without having to modify them at all. Move/Copy your UI-View map directory to AGWTracker (or leave it where it is, it does not matter) and you can use your entire UIV map investment.

When you consider how much is cost to get Precision Mapping, the registration fee for AGWTracker at $49, it is a wash.

So far I noticed that is does some things better than UI-View, and UI-View may have a few things up on AGWTracker (haven't found them yet, just speculating). But since UIV is no longer being developed, this gives some of us UIV users a place to go and a product that is being enhanced and maintained.

George has set-up a directory where you can download his latest beta version which is about to be released. He would just like some more beta testers. Let him know what you think, and what enhancements you would like. He is very responsive.

You can download it here:

http://www.elcom.gr/sv2agw/beta/

BTW, it does require that you use AGWPE (packet engine, which is free) whether or not you use a TNC.

You can download the free AGWPE here:

http://www.elcom.gr/sv2agw/inst.htm

Have fun playing with this new and very exciting APRS program.

Duffy

From: William McKeehan
Topic: 943 Message: 943

It looks like the UX-4 will not be APRS equiped...but if you're interested in the launch, here are the details.

---------- Original Message ----------
Subject: Mission Mini-Me (UX-4)
From: "Daniel Bowen" <dbowen1@...>
Date: Mon, November 28, 2005 9:06 pm
To: Chat@...

Launch of Mission Mini-Me (UX-4 tentative)

Place: University of Tennessee UC Launch Plaza

Crew Arrival Time: 9:00AM at the Shack

Launch time: 10:00AM Eastern

Launch date: Saturday, December 03, 2005

Frequency: 20m 14.3226MHz

Callsign: AA4UT/B

Radio Telemetry Format: CW beacon ID with temperature reading

We will spot the transmitter on DXclusters and there will be QSL info in the beacon ID. This is a test for the 20m antenna and transmitter implementations for future missions. We won't be chasing or retrieving this one, we'll just adjourn to the shack after launch and copy down the temperature readings by hand throughout the flight.

I was visualizing this unfolding as I read your email.? Ouch is all I could think of.? What about the DC power lines and/or the antenna coax?? Did they snap off or break off?? Sounds like the box separated completely from the bike.? Interesting news though?if you ever loose the keys. :-)

The box was self-contained with a 2.5 Ah battery in the box (this was the one piece that did not survive the drop), so there were no power lines going to the box. The antenna was attached to the top of the box. It is a rubber-duck style antenna and appears to have survived without any problems.

I need to get a picture of this box up so you guys can see how it was configured and what it looks like after the fall.

Kevin (KF4YMC) reported about 8:20PM Monday night that his screen "lit up" with the NWS stuff. I suspect they must run a "bridge" server between the NWS and APRS, but probably not at MRX, because this seemed to affect the entire SE US.

Not much DX cluster activity here. Middle TN has some active ones but I do not know of any in East TN.

I can confirm that there is a "bridge" server between NWS and APRS. It is WxSVR (http://www.wxsvr.net/). The software that it is running was developed by Dale Huguley, KG5QD. (http://www.aprs-is.net/Wx/).

On Tue, November 29, 2005 11:19 pm, Scott said:

From: Ben Sager
Topic: 943 Message: 952

The short answer to what it is, is that it is a software program that will send out on RF, normally VHF, the freq and callsign of a DX station. This will allow people to hopefully talk to the DX station and get a QSL card in return. My Kenwood TS-2000 has a builtin TNC that can be set to automatically switch the HF freq to whatever the TNC decoded. It is a rather slick operation. Yes, the TNC can be interfaced with most any type program used by "ordinary" TNC's as well or so the manual says...

OK - so a station somewhere sits and listens to a HF frequency (or a set of frequencies?) If it hears a DX station, it puts a packet out on another frequency. So if you are sitting at home, you can tune to the packet frequency and know when a DX contact is available. Have I got that correct?

How does the original station "hear" a DX station? Does it decode CW?

955. Re: [EastTNAPRS] [Fwd: Mission Mini-Me (UX-4)]

Yahoo group: EastTNAPRS
Date: 2005-11-30 16:42:14 UTC
From: John Moyers
Topic: 943 Message: 955

It relies on the control operators manual input after said operator has
already worked the DX station. After all you don't won't more competion
until after you have your QSO.....

From: Ben Sager
Topic: 943 Message: 956

You have it right and John is also correct. Some hams
are very big into chasing DX. A ham hears the station
and puts it out for anyone else who wants to work it..
A simple technique

957. Re: [EastTNAPRS] [Fwd: Mission Mini-Me (UX-4)]

Yahoo group: EastTNAPRS
Date: 2005-11-30 20:12:32 UTC
From: William McKeehan
Topic: 943 Message: 957

I'm learning...

Is the key to have a "local" packet based station that accepts DX reports from some local ham and then repeats this report back out? and is it this station that is known as the DX cluster?

Is the DX Cluster "software" something that runs on a computer or is it a particular firmware for a TNC?

Is there a good resource on the internet for me to get more information?

Yahoo group: EastTNAPRS
Date: 2005-11-30 20:16:51 UTC
From: John Moyers
Topic: 943 Message: 958

If memory serves me correctly, 10 years ago the DX Cluster was somewhere around 145.43 +/- 400 KHz. I don't know what happened to it since I was never much in favor of 15 second QSO's.....

Happy Hunting and CQ DX, CQ DX de N4QEA.....K

John

Topic: 943 Message: 959

Also, if memory serves me, you can run some software on your PC that will monitor this DX Packet Cluster and automatically tune your HF rig to the correct frequency.
David Hoffman - KE4FGW

960. Re: [EastTNAPRS] [Fwd: Mission Mini-Me (UX-4)]

Yahoo group: EastTNAPRS
Date: 2005-12-01 01:06:26 UTC
From: WB4E@arrl.net
Topic: 943 Message: 960

William,

A DX Cluster is a method of quickly passing information about DX stations between hams. When one hears a DX station on the air they can "spot" the station for other hams (usually after the spotter has already worked the DX station). The spot gives the callsigns of the stations spotted and spotting, frequency, date, time, and a brief comment. Armed with this information, within minutes of a rare station coming on frequency, the airways are jammed with hundreds of stations calling!

Originally, this information was passed via packet. In recent years the Internet has become the preferred vehicle for DX Clusters, using Telnet sessions.

I found this listing of DX Cluster frequencies in Tennessee, but note it's four years old.

Athens W4RJC-1 [ATHDX] 144.910
Bartlett K4VVM-3 145.670 (C KB4KA V K4VVM-3,989002)
Chattanooga K4JW 144.990
Collierville KB4KA 144.970 Hickory Withe DX Club
Concord K4IUV 441.000
Jackson KC4EUN-6 145.750 (C KB4KA V KC4EUN-6,989002)
Kingsport KA4IWG 145.750
Knoxville AG4M-3 [ETDXA] 147.585
Nashville K4CN 144.970, 145.585, 145.750
Memphis KN4F 144.950
Memphis KN4F [MEMDX] 144.910 (441.050) Dual Digi
Mt Juliet AA4DO 147.495
Oak Ridge NS4W 144.910, 147.585
Paris WT4DX-6 145.750 (C KB4KA V WT4DX-6,989002)
Somerville KB4KA-3 145.070 (C KB4KA V KB4KA-3,989002)

Update: October 26, 2001

The one that I was familar with for a while was on
144.93 back in VA. I don't remember the name of the
software used but I know the hams who used it paid a
small fee up front for it. This allowed them to use
the software and from that they could input DX
stations and receive DX stations listed by other
stations. the digi used was on a HIGH hill/mtn
somewhere. It worked well as long as someone was
around to input the data.. :))) I found that the
program Pacterm worked great if you just wanted to
receive the "broadcasts". It was not a "clean"
packet received but it got you the information you
were looking for. I've always found Pacterm a good
simple terminal program for lots of stuff, especially
for trips to remote node sites with a old laptop..

963. Launch of Mission Mini-Me (UX-4 tentative), 12/3/2005, 9:00 am

Yahoo group: EastTNAPRS
Date: 2005-12-02 13:59:37 UTC
From: EastTNAPRS@yahoogroups.com
Topic: 963 Message: 963

Reminder from the Calendar of EastTNAPRS
http://groups.yahoo.com/group/EastTNAPRS/cal

Launch of Mission Mini-Me (UX-4 tentative)
Saturday December 3, 2005
9:00 am - 2:00 pm
(This event does not repeat.)
Event Location: Place: University of Tennessee UC Launch Plaza

Notes:
Crew Arrival Time: 9:00AM at the Shack
Launch time: 10:00AM Eastern
Launch date: Saturday, December 03, 2005
Frequency: 20m 14.3226MHz
Callsign: AA4UT/B
Radio Telemetry Format: CW beacon ID with temperature reading

We will spot the transmitter on DXclusters and there will be QSL info in the beacon ID. This is a test for the 20m antenna and transmitter implementations for future missions. We won't be chasing or retrieving this one, we'll just adjourn to the shack after launch and copy down the temperature readings by hand throughout the flight.

Set up birthday reminders!

964. WA4KJH-7

Yahoo group: EastTNAPRS
Date: 2005-12-03 13:36:47 UTC
From: Ben Sager
Topic: 964 Message: 964

FWIW, I have noticed over the past month that I was having more and more problems getting my 5 watts digi'd by WA4KJH-7. I can increase the power to 25 but don't want to and at that level there still seems to be problems but not must of the time. I have checked things here and everything appears OK. I am now using N4TJM-1 and it to seems to not always get digi'd by KJH-7 either. Maybe the node is in a unheated building and has become a little detuned with the cooler weather? I have experienced that detuning before in VA with both older GE and Motorola rigs as the temperatures gets colder. And it may be as simple a thing as the node receiver front-end is overloaded with signals as John has mentioned before and my peanut whistle is not making it through. Anyhow, I have settled on N4TJM-1,WIDE1-1 as my default path after watching things for the last month. The old Adzen PCS-2000 rig, which has been used for packet for so many years, here has 5 LED's for an S meter and it shows KJH-7 with 5 LED's lite and TJM-1 as having 2 LED's lite here. I notice my actual path goes N4TJM-1, WA4BDS and then WIDE1* which must be KJH-7 digi-ing it. So I am passing this on just for information in case someone else is having a problem since the weather turned colder.

From: Kevin R. Colvin
Topic: 964 Message: 965

Ben,
Roy's station is digi'n your WIDE1-1. His UI-View digi is set up to "ID" when he digi's stations out so when you see WA4BDS,WIDE1* . That is the way his station shows he digi'd out a WIDEn-N.
KF4CFO-7 is set up the same way. If they were not set up as "ID" you would see something like this, N4TJM-1,WIDE1*. Using ID, you can trace who digi'd you. There is some controversy over ID vs NOID. But everybody has their opinion. And even the BRAINs keep changing their opinion.

966. [Fwd: UX-4 Mission postponed at least 24 hours]

Yahoo group: EastTNAPRS
Date: 2005-12-03 14:27:48 UTC
From: William McKeehan
Topic: 966 Message: 966

FYI

---------- Original Message ----------
Subject: UX-4 Mission postponed at least 24 hours
From: "Greg Williams" <k4hsm@...>
Date: Fri, December 2, 2005 10:16 pm
To: twiar@...
tnham@...
chat@...

Due to circumstances beyond our control at this time, UX-4 balloon mission from the University of Tennessee Amateur Radio Club has been postponed.

The earliest launch will be at 10 AM on Sunday, December 4. If weather or other circumstances prevent a launch then, we will target the weekend of December 10-11 to launch the test mission.

The mission, number UX-4, contains only a 20 meter CW beacon with battery voltage and transmission number being transmitted via the beacon. The power out is about 1 1/4 watt depending on antenna ERP. The frequency is 14.328 MHz CW. Callsign AA4UT/B

Success of this mission is reliant on the signal reports we get back from listeners. The 20m CW transmitter is being tested for use on a future mission that will relay telemetry readings as well as produce reception reports from earth stations on HF bands. If successful, the transmitter will be used on a flight in mid-December to deliver expanded telemetry readings about the payload as we attempt a reception distance record. Recovery operations are not planned for this flight as only the 20m beacon and battery are onboard. It will have a homemade parachute and ID tags on the payload in case it is recovered in a populated area.

UTARC will spot the transmitter on DXclusters and there will be QSL info in the beacon ID. If you would like to email your report, please send an email to info@... <mailto:info@...> with your Callsign, QTH, and signal report.

I have noticed that the number of stations that I am seeing has reduced over the past little bit also; maybe there is something going wrong with KJH-7.

I agree with Kevin about you seeing the WIDE1*; that is an indication that WA4BDS digi'd your packet and it's now done.

969. Re: [EastTNAPRS] WA4KJH-7

Yahoo group: EastTNAPRS
Date: 2005-12-03 15:47:06 UTC
From: Kevin R. Colvin
Topic: 964 Message: 969

THE FOLLOWING COMMENTS ARE BY James VE6SRV , BUT THEY COULD ANSWER THE REASON KJH-7 DOSEN'T HEAR AS WELL AS WE MIGHT EXPECT.

This concept is worthy of repeating ad naseum until everyone understands it completely. It is the fundamental reason why there is so much work being done to try and trim paths, and optimize settings.

A single radio frequency can only contain one signal at any given time (in the FM world of APRS). When my transmitter is keyed up, I am either sending data out for other stations to copy, or interfering with another station.

If my transmitter is on 100% of the time, I am the only user that can use the channel to send data. If I reduce my duty cycle to 50%, that channel can now be used by 2 users (at 50% duty cycle) to send their data. If a third station tries to join in on the channel using a 50% duty cycle, you are going to end up with virtually zero throughput.

While these are extreme values, the concept is valid... if there are enough stations transmitting the channel can be filled to capacity. So, at what point does the real world APRS channel get to the point that channel loading becomes a problem?

Channel loading is really a study in statistical analysis, factoring the number of users, and their transmission rates, etc. The simple answer is a rough estimate of around 60 users. Obviously 60 mobile users transmitting once every 2 minutes will load the channel much more than 60 home stations transmitting once every 10 minutes. So, some areas at times may see high utilization with 50 users, while you might be able to still fit more people on the channel in another are with 80 people in the area.

Now, the other half of the equation... what is the local "area"? Let's pretend we live way out in the boonies in Springfield, and have a single digipeater all by itself. Obviously anyone we hear on that digipeater is a "local" to the area. Any transmissions we hear on that digipeater are using up some of our local airtime, so we count that as part of the channel load. Let's also say that we get enough users that our local channel load gets up to 60%.

Down the road in Shelbyville, they too have a digipeater, and have also gotten to a channel load of 60%. All is fine and dandy, there's still lots of room for more users in each city. But, lets now add in the concept of paths. The APRS users in Springfield and Shelbyville have up until now been sending packets out with only a single hop since they were alone in the world. Now they have discovered that they can have a network, and share data between the two cities. So, everyone changes their paths to WIDE2-2, so that they can be seen in the neighboring community.

Anyone do the math yet? 60% channel load in Springfield plus the 60% channel load in Shelbyville equals 120% network channel load. So, what happens? We end up with reduced reliability and throughput due to collisions.

Let's take this concept and add another city, say Morganville as the third vertex on a triangle, and define the APRS network such that each city's digipeater can hear the other two. Let's also reduce the channel load in each city to 40%. You can see that we still have a 20% overload on the channel.

How do we relate this to the real world? Have a listen to your local digipeater. Count the number of stations heard on that digipeater. Count all of them, not just the ones that are heard by it on the first hop. Any packet digipeated by the digipeater is a packet that is adding to the channel load. APRS stations that are 3 hops away, and are showing up on your screen with WIDE3* are still considered local users, and are adding to your local channel load.

So, if your local channel load is getting really close to 100%, or even beyond that, what can you do to help reduce the load? The easiest solution is to ask everyone to reduce their path. Stations 3 hops away now no longer load your local digipeater. The local channel load drops, and reliability increases due to fewer collisions.

There are other ways to reduce channel loading, such as relocating the digipeaters to reduce the coverage area. Just like the cellphone companies, cell size is reduced as user density increases. Those mountaintop digipeaters that can hear for hundreds of miles around can effectively pull hundreds of users into areas that are already struggling under their local user burden. Adding another local digipeater to help with the load actually adds to the problem UNLESS each digipeater has a unique footprint. Adding digipeaters to the network without reducing the footprint of existing machines can simply increase the load.

I'd like to leave you with one final concept that gets missed by most people. Let's step back to Springfield and Shelbyville once again. Both have their local digipeater, which can hear the digipeater in the other city. In an effort to reduce channel loading, they decide to reduce their paths from WIDE2-2 down to WIDE2-1. This will keep their position reports local, only being digipeated by the local machine.

If you listened to the audio of the local digipeater in Shelbyville, you would be able to hear dead air, and could easily assume that there's room for more users. However, you have to remember that the Shelbyville digipeater can hear the Springfield digipeater. During that dead air that you hear in Shelbyville, the local digipeater may very well be listening to packets such as:

H0MER>WIDE2*: Mmmm, Donuts!
L1SA>WIDE2*: I want a pony.
MA6GIE>WIDE2*:<SUCK><SUCK>

A strong local station through the magic of FM capture effect might be able to get the attention of the Shelbyville digipeater, but a user on HT might not.

So, remember, even though it sounds like the local digipeater has a bunch of dead air time, it may actually be busy receiving packets with used up paths that it simply ignores.

James VE6SRV

Hello:

Yeah, late last night during the SKYWARN Special event I turned on
UI-View and started sending out bulletins.

Not sure if it will stay on past todays event, but look for WX4MRX on
147.030 and on HF. Send your current conditions via APRS as well.

Ok Kevin, thanks.. I didn't remember it doing that on
wide1-1 but my memory leaves much to be desired
sometimes.. :))

Ben, is all probability at 5 watts from your transmitter you are having collisions with other packets at KJH-7 or simply being completely overwhelmed and never heard from the other stations. In reality it is probably other nodes that KJH-7 is hearing and your packets are never heard.

The real cure to this is to take KJH-7 off the air and only use digi's at lower elevations. That is to say 3,000 feet and lower as opposed to kjh-7's 4,000 foot location. Personally I'm fine with this.

Subject: [EastTNAPRS] WA4KJH-7

FWIW, I have noticed over the past month that I was having more and more problems getting my 5 watts digi'd by WA4KJH-7. I can increase the power to 25 but don't want to and at that level there still seems to be problems but not must of the time. I have checked things here and everything appears OK. I am now using N4TJM-1 and it to seems to not always get digi'd by KJH-7 either. Maybe the node is in a unheated building and has become a little detuned with the cooler weather? I have experienced that detuning before in VA with both older GE and Motorola rigs as the temperatures gets colder. And it may be as simple a thing as the node receiver front-end is overloaded with signals as John has mentioned before and my peanut whistle is not making it through. Anyhow, I have settled on N4TJM-1,WIDE1-1 as my default path after watching things for the last month. The old Adzen PCS-2000 rig, which has been used for packet for so many years, here has 5 LED's for an S meter and it shows KJH-7 with 5 LED's lite and TJM-1 as having 2 LED's lite here. I notice my actual path goes N4TJM-1, WA4BDS and then WIDE1* which must be KJH-7 digi-ing it. So I am passing this on just for information in case someone else is having a problem since the weather turned colder.

John;

I would miss WA4KJH-7 if it were to go off the air. It is the only wide area digi that I
can hit most of the time. I hear lots others but they don't always hear me. I am at
about 1050 Ft elevation with J-Pole up about 20 feet with 20 Watts.

978. RE: [EastTNAPRS] WA4KJH-7

Yahoo group: EastTNAPRS
Date: 2005-12-04 13:43:44 UTC
From: Ben Sager
Topic: 964 Message: 978

John,

I would never ask you to take down your digi. I was simply stating that it may not be hearing me like it was or that something was going on with it. If it is a old GE in a cold building I know what happens to them, as I am sure you do to. I am not gonna run higher power just to get into it, that only hurts others. I have found a work around for it, so all is well here. If you get a chance to run up there to winterize it, as you mentioned early, maybe you will have the time to checkout the receiver cavities. I found them to be very tempermental during seasonal temperature changes as I'm sure you have.

Thank you for all your help and have a great Christmas!!

I agree!

If WA4KJH-7 were taken off the air, we would need to put somehing else up in it's place. Maybe not at the same location, but higher than the typical home digi's that are around 1000 ft ASL.

From: Kevin R. Colvin
Topic: 980 Message: 980

I AM WORKING WITH A COMPUTOR PROGRAM, "RADIO MOBILE" .
THIS PROGRAM AUTOMATICALY FIGURES A LOT OF VARIABLES.
WHICH ARE NOT ALWAYS CORRECT. ie: STATION ELEVATION

I WOULD LIKE APRS RF FIXED STATION's TO E-MAIL ME DIRECT, THE FOLOWING DATA, IF YOU WOULD BE SO KIND.

STATION CALL:
GPS LAT/LON (IF KNOWN):
GROUND ELEVATION :
ANTENNA HEIGHT ABOVE GROUND :
ANTENNA TYPE, ie: OMNI, BEAM :
ANTENNA dBi GAIN :
TRANSMITTER POWER OUT :
DIGI SETTING ie NONE, FILL-IN or FULL:

HAVEING THIS INFORMATION WILL ALLOW ME TO EVALUATE THIS PROGRAM WITH A LITTLE MORE ACCURACITY.

THANK YOU

KEVIN / KF4YMC <kf4ymc@localnet.com>

981. RE: [EastTNAPRS] WA4KJH-7

Yahoo group: EastTNAPRS
Date: 2005-12-04 19:17:34 UTC
From: John Moyers
Topic: 964 Message: 981

Guys, I do realize the benefit that KJH-7 provides and I'm not planning on taking it down anytime soon. I do have a new chip for it and I'm searching for a solution to a xcvr problem..... I haven't come up with one yet and this is something I'm just going to have to find on my own. The ham equipment isn't designed tough enough to stand up to the abuse and commercial equipment that can take it and tunable to the 144 MHz band are rare as hens teeth..... About the only ones you will find are surplused by the federal government and were used in the bottom end of the federal Hi-band VHF spectrum. Surplus means that it's close to 15 or 20 years old and slow on TX key up time and slow for RX recovery. Not good news in a digital world.

The truth of the matter concerning Ben's observation is that KJH-7 is at to high of an elevation to serve a local network properly. We do need some low level digi's for local work. Roughly 60 - 80% of the traffic that KJH-7 hears it never retransmits. But these signals create packet collisions with local traffic, so the local stations have to resend and resend until they get lucky and get a word in edge wise..... Kind of like taking a long trip with your wife, her mother, and her sister none of whom have seen each other in a long time. You aren't going to get a word in edge wise because no one will stop transmitting long enough so you can be heard. The same thing happens at KJH-7. This is further exaggerated by the fact that I have never upgraded KJH-7's TNC. I now have an EPROM that I think will do the job, but before I can install it I have to find the time. Once again this is something that I have to do even though the offers of help are appreciated. The equipment is old and some of it is being forced to perform a job it was never designed to do. I made the mods and I know the equipment, there for I have find the time to make the adjustments. Right now I don't know when that will be, but I do keep the chip in plain view on my desk as a constant reminder that I have do this, even though at the current priority levels it is way down on the list. Work has the idea that the State and Federal priorities take precedent over APRS, I don't think I have tell you the XYL's or my Harmonic's order of priorities.

In the mean time if some of you want to put up some wide digi's, be my guest. I've been hoping for some of these since the early days of APRS when the main interest was in Maryland and Atlanta. There were no digi's in Kentucky, northern Georgia, or western North Carolina. In those days KJH-7 had to be at a high elevation in order to get any connectivity out of East TN. What we DO NOT need is a bunch of WIDE digi's run from QTH's. Unless you live on top of English Mountain, Top-O-The-World, or some where else of similar elevation you simply aren't high enough to be a wide. Sorry but those are the facts of living in East TN.

You all take care and have a Merry Christmas and a Happy New Year,

John Moyers, N4QEA

I agree!

If WA4KJH-7 were taken off the air, we would need to put somehing else up in
it's place. Maybe not at the same location, but higher than the typical home
digi's that are around 1000 ft ASL.

From: Kevin R. Colvin
Topic: 964 Message: 982

MessageIRT THE COMMENT: In the mean time if some of you want to put up some wide digi's, be my guest. I've been hoping for some of these since the early days of APRS .
PLEASE REMEMBER: Adding another local digipeater to help with the load actually adds to the problem UNLESS each digipeater has a unique footprint. Adding digipeaters to the network without reducing the footprint of existing machines can simply increase the load.

AND HERE'S A NOTE TO JONH. NOPONE IS A GREAT SIGHT FOR A DIGI AS YOU STATED EARLIER. BUT IT REALY WILL NOT HELP THE KNOXVILLE AREA GUYS. CURRENTLY A SITE HAS BE AQURIED ON A NOPONE TOWER, A KPC-3 VER9.1 PURCHASED, A G7-144 AQUIRED, COAX PROVIDED, AND TESTING OUT SEVERAL TRANSMITTERS TO SEE WHICH ONE WE PREFER. ONCE THE MINI CABNET IS SET UP ON SITE, THINGS WILL BE PUT INTO MOTION. AND WHEN THE NOPONE DIGI GOES ON LIKE, KF4CFO-7 WILL BE ADJUSTED TO ACT AS A FILL-IN DIGI. JUST A FYI, SO YOU KNOW.

KEVIN / KF4YMC

Subject: RE: [EastTNAPRS] WA4KJH-7

Guys, I do realize the benefit that KJH-7 provides and I'm not planning on taking it down anytime soon. I do have a new chip for it and I'm searching for a solution to a xcvr problem..... I haven't come up with one yet and this is something I'm just going to have to find on my own. The ham equipment isn't designed tough enough to stand up to the abuse and commercial equipment that can take it and tunable to the 144 MHz band are rare as hens teeth..... About the only ones you will find are surplused by the federal government and were used in the bottom end of the federal Hi-band VHF spectrum. Surplus means that it's close to 15 or 20 years old and slow on TX key up time and slow for RX recovery. Not good news in a digital world.

The truth of the matter concerning Ben's observation is that KJH-7 is at to high of an elevation to serve a local network properly. We do need some low level digi's for local work. Roughly 60 - 80% of the traffic that KJH-7 hears it never retransmits. But these signals create packet collisions with local traffic, so the local stations have to resend and resend until they get lucky and get a word in edge wise..... Kind of like taking a long trip with your wife, her mother, and her sister none of whom have seen each other in a long time. You aren't going to get a word in edge wise because no one will stop transmitting long enough so you can be heard. The same thing happens at KJH-7. This is further exaggerated by the fact that I have never upgraded KJH-7's TNC. I now have an EPROM that I think will do the job, but before I can install it I have to find the time. Once again this is something that I have to do even though the offers of help are appreciated. The equipment is old and some of it is being forced to perform a job it was never designed to do. I made the mods and I know the equipment, there for I have find the time to make the adjustments. Right now I don't know when that will be, but I do keep the chip in plain view on my desk as a constant reminder that I have do this, even though at the current priority

levels it is way down on the list. Work has the idea that the State and Federal priorities take precedent over APRS, I don't think I have tell you the XYL's or my Harmonic's order of priorities.

In the mean time if some of you want to put up some wide digi's, be my guest. I've been hoping for some of these since the early days of APRS when the main interest was in Maryland and Atlanta. There were no digi's in Kentucky, northern Georgia, or western North Carolina. In those days KJH-7 had to be at a high elevation in order to get any connectivity out of East TN. What we DO NOT need is a bunch of WIDE digi's run from QTH's. Unless you live on top of English Mountain, Top-O-The-World, or some where else of similar elevation you simply aren't high enough to be a wide. Sorry but those are the facts of living in East TN.

You all take care and have a Merry Christmas and a Happy New Year,

John Moyers, N4QEA

From: Ben Sager
Topic: 964 Message: 983

John,

I understand your frustration very well and will do what I can to help out. I do have some equipment left from my VA operations such as Motorola transceivers and MFJ tnc's that are programmed with X1J4 code for node/digi operations.. The TNC's are modified MFJ-1270C's. The transceivers are 1 hardly ever used Alinco DR-140T, which is a packet only radio, and I have a couple Motorola VHF Radius mobiles left that have super tight front ends and up to 50 watts output.. I never ran them over 40 watts though and never had 1 fail. I also never had an interference report using this type equipment at any site and we were normally neighbors with commerical users. By "mobile" I mean the transceiver is the size of a modern mobile ham transceiver. I had up to 10 remote nodes going at one time on packet in VA with this type of equipment.. I usually had 1 VHF and 1 UHF Radius at a location with a crossover link.. BUT I don't have a eprom burner to change the alaises, etc., anymore though.. However, they would perform better than nothing should a situation come up. High places and the Motorolas get along very well.. So if any of this would help, I will gladly lend them to the East Tennessee cause. OH, too bad APRS doesn't use some UHF! :))

I must say that my health does not allow me to run around over the countryside anymore on maintenance trips but I can help in other ways. Let me know if this equipment can help.

984. RE: [EastTNAPRS] WA4KJH-7

Yahoo group: EastTNAPRS
Date: 2005-12-04 22:14:59 UTC
From: John Moyers
Topic: 964 Message: 984

Ben, This a similar setup to how KJH-7 got started. It was originally in a node stack on a matrix with all nodes running X1J4 firmware. Then I switched it over to APRS which I think was on 145.39 back then. As the International space station started looking more and more like a reality a push started to move all of the APRS traffic to it's current Fq. Ok, that's history along with the mods that had to be done to the GE Exec II we were and are still using. Yes the radio's are clean, the transmitters moved a lot easier than the receivers. The receivers preselector filter was not designed to operate at 144 MHz. This design limitation has affected RX Sensitivity, couple that with all the other APRS transmitters that KJH-7 can hear and it amazing that it works as well as it does. I'll be curious is you can get the Radius to tune up with a respectable RX Sinad on 144 MHz. This is where I've been having the problems. If I can't find a commercial receiver that will work better than what we already have then I don't see a reason to change the radio. Although I am hearing that Motorola is coming out with some radio's that will have the band pass to allow this. The problem is, I don't want to pay $1,500 for an APRS radio..... :-)

So let me know how the Radius works.

Subject: RE: [EastTNAPRS] WA4KJH-7

John,

I understand your frustration very well and will do what I can to help out. I do have some equipment left from my VA operations such as Motorola transceivers and MFJ tnc's that are programmed with X1J4 code for node/digi operations.. The TNC's are modified MFJ-1270C's. The transceivers are 1 hardly ever used Alinco DR-140T, which is a packet only radio, and I have a couple Motorola VHF Radius mobiles left that have super tight front ends and up to 50 watts output.. I never ran them over 40 watts though and never had 1 fail. I also never had an interference report using this type equipment at any site and we were normally neighbors with commerical users. By "mobile" I mean the transceiver is the size of a

modern mobile ham transceiver. I had up to 10 remote nodes going at one time on packet in VA with this type of equipment.. I usually had 1 VHF and 1 UHF Radius at a location with a crossover link.. BUT I don't have a eprom burner to change the alaises, etc., anymore though.. However, they would perform better than nothing should a situation come up. High places and the Motorolas get along very well.. So if any of this would help, I will gladly lend them to the East Tennessee cause. OH, too bad APRS doesn't use some UHF! :))

I must say that my health does not allow me to run around over the countryside anymore on maintenance trips but I can help in other ways. Let me know if this equipment can help.

In addition to a radio and TNC, what is required to co-locate a digi at a repeater site?

It seems that some of the lower level repeater locations in the area may be good locations for digi's - maybe fill-in only digi's. Thoughts?

A antenna and coax/hardline.. Possibly a power
supply..

Well John, the Radius is programmed by a computer program from Motorola and it has no problem getting to 144 and working quite well. I ran them on 145.73 and they do fine.

From: William McKeehan
Topic: 964 Message: 988

Anything to keep the repeater from overloading the frontend of the APRS receiver?

989. RE: [EastTNAPRS] WA4KJH-7

Yahoo group: EastTNAPRS
Date: 2005-12-05 01:57:22 UTC
From: John Moyers
Topic: 964 Message: 989

True, depending on the repeater and it's frequency, how the deviation is set up on the digi and several other considerations. KJH-7 also uses a duplexer. There is one ham repeater in East TN that has problems with any digipeater on the mountain with it. Part of this is due to digi owners setting their deviation higher than 3.5 KHz. I have my theories on the other problems..... Micor's were not designed to work with sinad of 0.25 uV or less. I'll let you all figure out what has to be done to accomplish this, but I will give a hint, the mods on the repeater are part of the problem. Suffice it to say, that the digipeater deviation levels have caused enough problems at enough sites that many will not allow them to be installed. It isn't a problem with KJH-7. The digi, 25/85 repeater, and a public safety repeater work very well with each other at the same site without any interference that we have been able to find, and have done so for YEARS. So we know they can co-exist with the proper adjustments to all of the equipment at the site.

From: John Moyers
Topic: 964 Message: 990

Yes it is programmable and will work fairly well on 145.73..... Do a sinad test on it on this freq and then reprogram it to the APRS freq and do another Sinad test and tell me what the results are.... Please..... I'm really hoping it's front-end is as broad as you think it is. My experience hasn't been that good. BTW a Radius should do about 0.35uV @ -12 <mailto:0.35uV@-12> db Sinad or better on it's designed band, and I'm real curious what you will get on 144.39 MHz. Most Motorola front-ends will not shift 10 MHz out of band. Working quite well is a relative term, I want to know the measured Sinad levels at 144.39 MHz. 0.40uV@-12 db Sinad or higher is unacceptable for reliable use with a digi. KJH-7 used to get 0.32uV@-12db Sinad back when we ran it in the 145 MHz part of the band. When we dropped the Frequency to 144.39 MHz that Sinad level increased to ~0.41uV@-12db Sinad. It may be a little higher than that now.... It's been over a year since I checked it's receiver sensitivity.

Well John, the Radius is programmed by a computer program from Motorola and it has no problem getting to 144 and working quite well. I ran them on 145.73 and they do fine.

991. RE: [EastTNAPRS] WA4KJH-7

Yahoo group: EastTNAPRS
Date: 2005-12-05 02:22:33 UTC
From: John Moyers
Topic: 964 Message: 991

William,

That all depends on antenna locations and frequency separation. Most of the time the problem is the digi desenses the voice repeater's receiver.

John Moyers
